Chapter 1

GnuTLS API Reference Manual

GnuTLS implements the TLS (Transport Layer Security) and SSL (Secure Sockets Layer) protocols for the GNU project. More up to date information can be found at <http://www.gnu.org/software/gnutls/>.

1.1 gnutls

gnutls —

Enumeration of different symmetric encryption algorithms.

GNUTLS_CIPHER_UNKNOWN Unknown algorithm.

GNUTLS_CIPHER_NULL NULL algorithm.

GNUTLS_CIPHER_ARCFOUR_128 ARCFour stream cipher with 128-bit keys.

GNUTLS_CIPHER_3DES_CBC 3DES in CBC mode.

GNUTLS_CIPHER_AES_128_CBC AES in CBC mode with 128-bit keys.

GNUTLS_CIPHER_AES_256_CBC AES in CBC mode with 256-bit keys.

GNUTLS_CIPHER_ARCFOUR_40 ARCFour stream cipher with 40-bit keys.

GNUTLS_CIPHER_CAMELLIA_128_CBC Camellia in CBC mode with 128-bit keys.

GNUTLS_CIPHER_CAMELLIA_256_CBC Camellia in CBC mode with 256-bit keys.

GNUTLS_CIPHER_RC2_40_CBC RC2 in CBC mode with 40-bit keys.

GNUTLS_CIPHER_DES_CBC DES in CBC mode (56-bit keys).

GNUTLS_CIPHER_AES_192_CBC AES in CBC mode with 192-bit keys.

GNUTLS_CIPHER_IDEA_PGP_CFB IDEA in CFB mode.

GNUTLS_CIPHER_3DES_PGP_CFB 3DES in CFB mode.

GNUTLS_CIPHER_CAST5_PGP_CFB CAST5 in CFB mode.

GNUTLS_CIPHER_BLOWFISH_PGP_CFB Blowfish in CFB mode.

GNUTLS_CIPHER_SAVER_SK128_PGP_CFB Safer-SK in CFB mode with 128-bit keys.

GNUTLS_CIPHER_AES128_PGP_CFB AES in CFB mode with 128-bit keys.

GNUTLS_CIPHER_AES192_PGP_CFB AES in CFB mode with 192-bit keys.

GNUTLS_CIPHER_AES256_PGP_CFB AES in CFB mode with 256-bit keys.

GNUTLS_CIPHER_TWOFISH_PGP_CFB Twofish in CFB mode.

    GNUTLS_A_INNER_APPLICATION_FAILURE = 208,
    GNUTLS_A_INNER_APPLICATION_VERIFICATION = 209
} gnutls_alert_description_t;
```

Enumeration of different TLS alerts.

GNUTLS_A_CLOSE_NOTIFY Close notify.

GNUTLS_A_UNEXPECTED_MESSAGE Unexpected message.

GNUTLS_A_BAD_RECORD_MAC Bad record MAC.

GNUTLS_A_DECRIPTION_FAILED Decryption failed.

GNUTLS_A_RECORD_OVERFLOW Record overflow.

GNUTLS_A_DECOMPRESSION_FAILURE Decompression failed.

GNUTLS_A_HANDSHAKE_FAILURE Handshake failed.

GNUTLS_A_SSL3_NO_CERTIFICATE No certificate.

GNUTLS_A_BAD_CERTIFICATE Certificate is bad.

GNUTLS_A_UNSUPPORTED_CERTIFICATE Certificate is not supported.

GNUTLS_A_CERTIFICATE_REVOKED Certificate was revoked.

GNUTLS_A_CERTIFICATE_EXPIRED Certificate is expired.

GNUTLS_A_CERTIFICATE_UNKNOWN Unknown certificate.

GNUTLS_A_ILLEGAL_PARAMETER Illegal parameter.

GNUTLS_A_UNKNOWN_CA CA is unknown.

GNUTLS_A_ACCESS_DENIED Access was denied.

GNUTLS_A_DECODE_ERROR Decode error.

GNUTLS_A_DECRYPT_ERROR Decrypt error.

GNUTLS_A_EXPORT_RESTRICTION Export restriction.

GNUTLS_A_PROTOCOL_VERSION Error in protocol version.

GNUTLS_A_INSUFFICIENT_SECURITY Insufficient security.

GNUTLS_A_INTERNAL_ERROR Internal error.

GNUTLS_A_USER_CANCELED User canceled.

GNUTLS_A_NO_RENEGOTIATION No renegotiation is allowed.

GNUTLS_A_UNSUPPORTED_EXTENSION An unsupported extension was sent.

GNUTLS_A_CERTIFICATE_UNOBTAINABLE Could not retrieve the specified certificate.

GNUTLS_A_UNRECOGNIZED_NAME The server name sent was not recognized.

GNUTLS_A_UNKNOWN_PSK_IDENTITY The SRP/PSK username is missing or not known.

GNUTLS_A_INNER_APPLICATION_FAILURE Inner application negotiation failed.

GNUTLS_A_INNER_APPLICATION_VERIFICATION Inner application verification failed.

enum gnutls_handshake_description_t

```
typedef enum
{

    GNUTLS_CERT_NOT_ACTIVATED = 512,
    GNUTLS_CERT_EXPIRED = 1024
} gnutls_certificate_status_t;
```

Enumeration of certificate status codes. Note that the status bits have different meanings in OpenPGP keys and X.509 certificate verification.

GNUTLS_CERT_INVALID Will be set if the certificate was not verified.

GNUTLS_CERT_REVOKED Certificate revoked. In X.509 this will be set only if CRLs are checked.

GNUTLS_CERT_SIGNER_NOT_FOUND Certificate not verified. Signer not found.

GNUTLS_CERT_SIGNER_NOT_CA Certificate not verified. Signer not a CA certificate.

GNUTLS_CERT_INSECURE_ALGORITHM Certificate not verified, insecure algorithm.

GNUTLS_CERT_NOT_ACTIVATED Certificate not yet activated.

GNUTLS_CERT_EXPIRED Certificate expired.

enum gnutls_certificate_request_t

```
typedef enum
{
    GNUTLS_CERT_IGNORE = 0,
    GNUTLS_CERT_REQUEST = 1,
    GNUTLS_CERT_REQUIRE = 2
} gnutls_certificate_request_t;
```

Enumeration of certificate request types.

GNUTLS_CERT_IGNORE Ignore certificate.

GNUTLS_CERT_REQUEST Request certificate.

GNUTLS_CERT_REQUIRE Require certificate.

enum gnutls_openpgp_crt_status_t

```
typedef enum
{
    GNUTLS_OPENPGP_CERT = 0,
    GNUTLS_OPENPGP_CERT_FINGERPRINT = 1
} gnutls_openpgp_crt_status_t;
```

Enumeration of ways to send OpenPGP certificate.

GNUTLS_OPENPGP_CERT Send entire certificate.

GNUTLS_OPENPGP_CERT_FINGERPRINT Send only certificate fingerprint.

enum gnutls_close_request_t

```
typedef enum
{
    GNUTLS_SHUT_RDWR = 0,
    GNUTLS_SHUT_WR = 1
} gnutls_close_request_t;
```

Enumeration of how TLS session should be terminated. See [gnutls_bye\(\)](#).

GNUTLS_SHUT_RDWR Disallow further receives/sends.

GNUTLS_SHUT_WR Disallow further sends.

enum gnutls_protocol_t

```
typedef enum
{
    GNUTLS_SSL3 = 1,
    GNUTLS_TLS1_0 = 2,
    GNUTLS_TLS1 = GNUTLS_TLS1_0,
    GNUTLS_TLS1_1 = 3,
    GNUTLS_TLS1_2 = 4,
    GNUTLS_VERSION_MAX = GNUTLS_TLS1_2,
    GNUTLS_VERSION_UNKNOWN = 0xff
} gnutls_protocol_t;
```

Enumeration of different SSL/TLS protocol versions.

GNUTLS_SSL3 SSL version 3.0.

GNUTLS_TLS1_0 TLS version 1.0.

GNUTLS_TLS1 Same as [GNUTLS_TLS1_0](#).

GNUTLS_TLS1_1 TLS version 1.1.

GNUTLS_TLS1_2 TLS version 1.2.

GNUTLS_VERSION_MAX Maps to the highest supported TLS version.

GNUTLS_VERSION_UNKNOWN Unknown SSL/TLS version.

enum gnutls_certificate_type_t

```
typedef enum
{
    GNUTLS_CRT_UNKNOWN = 0,
    GNUTLS_CRT_X509 = 1,
    GNUTLS_CRT_OPENPGP = 2
} gnutls_certificate_type_t;
```

Enumeration of different certificate types.

GNUTLS_CRT_UNKNOWN Unknown certificate type.

GNUTLS_CRT_X509 X.509 Certificate.

GNUTLS_CRT_OPENPGP OpenPGP certificate.

enum gnutls_x509_crt_fmt_t

```
typedef enum
{
    GNUTLS_X509_FMT_DER = 0,
    GNUTLS_X509_FMT_PEM = 1
} gnutls_x509_crt_fmt_t;
```

Enumeration of different certificate encoding formats.

GNUTLS_X509_FMT_DER X.509 certificate in DER format (binary).

GNUTLS_X509_FMT_PEM X.509 certificate in PEM format (text).

enum gnutls_certificate_print_formats_t

```
typedef enum gnutls_certificate_print_formats
{
    GNUTLS_CRT_PRINT_FULL = 0,
    GNUTLS_CRT_PRINT_ONELINE = 1,
    GNUTLS_CRT_PRINT_UNSIGNED_FULL = 2
} gnutls_certificate_print_formats_t;
```

Enumeration of different certificate printing variants.

GNUTLS_CRT_PRINT_FULL Full information about certificate.

GNUTLS_CRT_PRINT_ONELINE Information about certificate in one line.

GNUTLS_CRT_PRINT_UNSIGNED_FULL All info for an unsigned certificate.

enum gnutls_pk_algorithm_t

```
typedef enum
{
    GNUTLS_PK_UNKNOWN = 0,
    GNUTLS_PK_RSA = 1,
    GNUTLS_PK_DSA = 2,
    GNUTLS_PK_DH = 3
} gnutls_pk_algorithm_t;
```

Enumeration of different public-key algorithms.

GNUTLS_PK_UNKNOWN Unknown public-key algorithm.

GNUTLS_PK_RSA RSA public-key algorithm.

GNUTLS_PK_DSA DSA public-key algorithm.

GNUTLS_PK_DH Diffie-Hellman algorithm. Used to generate parameters.

gnutls_pk_algorithm_get_name ()

```
const char * gnutls_pk_algorithm_get_name (gnutls_pk_algorithm_t algorithm);
```

Convert a **gnutls_pk_algorithm_t** value to a string.

algorithm: is a pk algorithm

Returns : a string that contains the name of the specified public key algorithm, or **NULL**.

enum gnutls_sign_algorithm_t

```
typedef enum
{
    GNUTLS_SIGN_UNKNOWN = 0,
    GNUTLS_SIGN_RSA_SHA1 = 1,
    GNUTLS_SIGN_RSA_SHA = GNUTLS_SIGN_RSA_SHA1,
    GNUTLS_SIGN_DSA_SHA1 = 2,
    GNUTLS_SIGN_DSA_SHA = GNUTLS_SIGN_DSA_SHA1,
    GNUTLS_SIGN_RSA_MD5 = 3,
    GNUTLS_SIGN_RSA_MD2 = 4,
    GNUTLS_SIGN_RSA_RMD160 = 5,
    GNUTLS_SIGN_RSA_SHA256 = 6,
    GNUTLS_SIGN_RSA_SHA384 = 7,
    GNUTLS_SIGN_RSA_SHA512 = 8,
    GNUTLS_SIGN_RSA_SHA224 = 9,
    GNUTLS_SIGN_DSA_SHA224 = 10,
    GNUTLS_SIGN_DSA_SHA256 = 11
} gnutls_sign_algorithm_t;
```

Enumeration of different digital signature algorithms.

GNUTLS_SIGN_UNKNOWN Unknown signature algorithm.

GNUTLS_SIGN_RSA_SHA1 Digital signature algorithm RSA with SHA-1

GNUTLS_SIGN_RSA_SHA Same as **GNUTLS_SIGN_RSA_SHA1**.

GNUTLS_SIGN_DSA_SHA1 Digital signature algorithm DSA with SHA-1

GNUTLS_SIGN_DSA_SHA Same as **GNUTLS_SIGN_DSA_SHA1**.

GNUTLS_SIGN_RSA_MD5 Digital signature algorithm RSA with MD5.

GNUTLS_SIGN_RSA_MD2 Digital signature algorithm RSA with MD2.

GNUTLS_SIGN_RSA_RMD160 Digital signature algorithm RSA with RMD-160.

GNUTLS_SIGN_RSA_SHA256 Digital signature algorithm RSA with SHA-256.

GNUTLS_SIGN_RSA_SHA384 Digital signature algorithm RSA with SHA-384.

GNUTLS_SIGN_RSA_SHA512 Digital signature algorithm RSA with SHA-512.

GNUTLS_SIGN_RSA_SHA224 Digital signature algorithm RSA with SHA-224.

GNUTLS_SIGN_DSA_SHA224 Digital signature algorithm DSA with SHA-224

GNUTLS_SIGN_DSA_SHA256 Digital signature algorithm DSA with SHA-256

gnutls_sign_algorithm_get_name ()

```
const char * gnutls_sign_algorithm_get_name (gnutls_sign_algorithm_t sign);
```

Convert a `gnutls_sign_algorithm_t` value to a string.

sign : is a sign algorithm

Returns : a string that contains the name of the specified sign algorithm, or **NULL**.

enum gnutls_sec_param_t

```
typedef enum
{
    GNUTLS_SEC_PARAM_UNKNOWN,
    GNUTLS_SEC_PARAM_WEAK,
    GNUTLS_SEC_PARAM_LOW,
    GNUTLS_SEC_PARAM_NORMAL,
    GNUTLS_SEC_PARAM_HIGH,
    GNUTLS_SEC_PARAM_ULTRA
} gnutls_sec_param_t;
```

Enumeration of security parameters for passive attacks

GNUTLS_SEC_PARAM_UNKNOWN Cannot be known

GNUTLS_SEC_PARAM_WEAK 50 or less bits of security

GNUTLS_SEC_PARAM_LOW 80 bits of security

GNUTLS_SEC_PARAM_NORMAL 112 bits of security

GNUTLS_SEC_PARAM_HIGH 128 bits of security

GNUTLS_SEC_PARAM_ULTRA 192 bits of security

enum gnutls_channel_binding_t

```
typedef enum
{
    GNUTLS_CB_TLS_UNIQUE
} gnutls_channel_binding_t;
```

Enumeration of support channel binding types.

GNUTLS_CB_TLS_UNIQUE "tls-unique" (RFC 5929) channel binding

gnutls_transport_ptr_t

```
typedef void *gnutls_transport_ptr_t;
```

struct gnutls_session_int

```
struct gnutls_session_int;
```

gnutls_session_t

```
typedef struct gnutls_session_int *gnutls_session_t;
```

struct gnutls_dh_params_int

```
struct gnutls_dh_params_int;
```

gnutls_dh_params_t

```
typedef struct gnutls_dh_params_int *gnutls_dh_params_t;
```

struct gnutls_x509_privkey_int

```
struct gnutls_x509_privkey_int;
```

gnutls_rsa_params_t

```
typedef struct gnutls_x509_privkey_int *gnutls_rsa_params_t;
```

struct gnutls_priority_st

```
struct gnutls_priority_st;
```

gnutls_priority_t

```
typedef struct gnutls_priority_st *gnutls_priority_t;
```

gnutls_init ()

```
int gnutls_init (gnutls_session_t *session,  
gnutls_connection_end_t con_end);
```

This function initializes the current session to null. Every session must be initialized before use, so internal structures can be allocated. This function allocates structures which can only be free'd by calling [gnutls_deinit\(\)](#). Returns zero on success.

con_end can be one of [GNUTLS_CLIENT](#) and [GNUTLS_SERVER](#).

session : is a pointer to a [gnutls_session_t](#) structure.

con_end : indicate if this session is to be used for server or client.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_deinit ()

```
void gnutls_deinit (gnutls_session_t session);
```

This function clears all buffers associated with the *session*. This function will also remove session data from the session database if the session was terminated abnormally.

session : is a [gnutls_session_t](#) structure.

gnutls_bye ()

```
int gnutls_bye (gnutls_session_t session,
                gnutls_close_request_t how);
```

Terminates the current TLS/SSL connection. The connection should have been initiated using [gnutls_handshake\(\)](#). *how* should be one of [GNUTLS_SHUT_RDWR](#), [GNUTLS_SHUT_WR](#).

In case of [GNUTLS_SHUT_RDWR](#) then the TLS connection gets terminated and further receives and sends will be disallowed. If the return value is zero you may continue using the connection. [GNUTLS_SHUT_RDWR](#) actually sends an alert containing a close request and waits for the peer to reply with the same message.

In case of [GNUTLS_SHUT_WR](#) then the TLS connection gets terminated and further sends will be disallowed. In order to reuse the connection you should wait for an EOF from the peer. [GNUTLS_SHUT_WR](#) sends an alert containing a close request.

Note that not all implementations will properly terminate a TLS connection. Some of them, usually for performance reasons, will terminate only the underlying transport layer, thus causing a transmission error to the peer. This error cannot be distinguished from a malicious party prematurely terminating the session, thus this behavior is not recommended.

This function may also return [GNUTLS_E AGAIN](#) or [GNUTLS_E_INTERRUPTED](#); cf. [gnutls_record_get_direction\(\)](#).

session : is a [gnutls_session_t](#) structure.

how : is an integer

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code, see function documentation for entire semantics.

gnutls_handshake ()

```
int gnutls_handshake (gnutls_session_t session);
```

This function does the handshake of the TLS/SSL protocol, and initializes the TLS connection.

This function will fail if any problem is encountered, and will return a negative error code. In case of a client, if the client has asked to resume a session, but the server couldn't, then a full handshake will be performed.

The non-fatal errors such as [GNUTLS_E AGAIN](#) and [GNUTLS_E_INTERRUPTED](#) interrupt the handshake procedure, which should be later be resumed. Call this function again, until it returns 0; cf. [gnutls_record_get_direction\(\)](#) and [gnutls_error_is_fatal\(\)](#).

If this function is called by a server after a rehandshake request then [GNUTLS_E GOT APPLICATION DATA](#) or [GNUTLS_E_WARN](#) may be returned. Note that these are non fatal errors, only in the specific case of a rehandshake. Their meaning is that the client rejected the rehandshake request or in the case of [GNUTLS_E GOT APPLICATION DATA](#) it might also mean that some data were pending.

session : is a [gnutls_session_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

gnutls_rehandshake ()

```
int gnutls_rehandshake(gnutls_session_t session);
```

This function will renegotiate security parameters with the client. This should only be called in case of a server.

This message informs the peer that we want to renegotiate parameters (perform a handshake).

If this function succeeds (returns 0), you must call the [gnutls_handshake\(\)](#) function in order to negotiate the new parameters.

Since TLS is full duplex some application data might have been sent during peer's processing of this message. In that case one should call [gnutls_record_recv\(\)](#) until GNUTLS_E_REHANDSHAKE is returned to clear any pending data. Care must be taken if rehandshake is mandatory to terminate if it does not start after some threshold.

If the client does not wish to renegotiate parameters he will respond with an alert message, thus the return code will be [GNUTLS_E_WARNING_ALERT_RECEIVED](#) and the alert will be [GNUTLS_A_NO_RENEGOTIATION](#). A client may also choose to ignore this message.

session : is a [gnutls_session_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

gnutls_alert_get ()

```
gnutls_alert_description_t gnutls_alert_get(gnutls_session_t session);
```

This function will return the last alert number received. This function should be called if [GNUTLS_E_WARNING_ALERT_RECEIVED](#) or [GNUTLS_E_FATAL_ALERT_RECEIVED](#) has been returned by a gnutls function. The peer may send alerts if he thinks some things were not right. Check gnutls.h for the available alert descriptions.

If no alert has been received the returned value is undefined.

session : is a [gnutls_session_t](#) structure.

Returns : returns the last alert received, a [gnutls_alert_description_t](#) value.

gnutls_alert_send ()

```
int gnutls_alert_send(gnutls_session_t session,
                      gnutls_alert_level_t level,
                      gnutls_alert_description_t desc);
```

This function will send an alert to the peer in order to inform him of something important (eg. his Certificate could not be verified). If the alert level is Fatal then the peer is expected to close the connection, otherwise he may ignore the alert and continue.

The error code of the underlying record send function will be returned, so you may also receive [GNUTLS_E_INTERRUPTED](#) or [GNUTLS_E_AGAIN](#) as well.

session : is a [gnutls_session_t](#) structure.

level : is the level of the alert

desc : is the alert description

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_alert_send_appropriate ()

```
int gnutls_alert_send_appropriate (gnutls_session_t session,  
                                  int err);
```

Sends an alert to the peer depending on the error code returned by a gnutls function. This function will call [gnutls_error_to_alert\(\)](#) to determine the appropriate alert to send.

This function may also return [GNUTLS_E AGAIN](#), or [GNUTLS_E_INTERRUPTED](#).

If the return value is [GNUTLS_E_INVALID_REQUEST](#), then no alert has been sent to the peer.

session : is a [gnutls_session_t](#) structure.

err : is an integer

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_alert_get_name ()

```
const char * gnutls_alert_get_name (gnutls_alert_description_t alert);
```

This function will return a string that describes the given alert number, or [NULL](#). See [gnutls_alert_get\(\)](#).

alert : is an alert number [gnutls_session_t](#) structure.

Returns : string corresponding to [gnutls_alert_description_t](#) value.

gnutls_pk_bits_to_sec_param ()

```
gnutls_sec_param_t gnutls_pk_bits_to_sec_param (gnutls_pk_algorithm_t algo,  
                                                unsigned int bits);
```

This is the inverse of [gnutls_sec_param_to_pk_bits\(\)](#). Given an algorithm and the number of bits, it will return the security parameter. This is a rough indication.

algo : is a public key algorithm

bits : is the number of bits

Returns : The security parameter.

gnutls_sec_param_get_name ()

```
const char * gnutls_sec_param_get_name (gnutls_sec_param_t param);
```

Convert a [gnutls_sec_param_t](#) value to a string.

param : is a security parameter

Returns : a pointer to a string that contains the name of the specified public key algorithm, or [NULL](#).

gnutls_sec_param_to_pk_bits ()

```
unsigned int gnutls_sec_param_to_pk_bits (gnutls_pk_algorithm_t algo,  
                                         gnutls_sec_param_t param);
```

When generating private and public key pairs a difficult question is which size of "bits" the modulus will be in RSA and the group size in DSA. The easy answer is 1024, which is also wrong. This function will convert a human understandable security parameter to an appropriate size for the specific algorithm.

algo : is a public key algorithm

param : is a security parameter

Returns : The number of bits, or zero.

gnutls_cipher_get ()

```
gnutls_cipher_algorithm_t gnutls_cipher_get (gnutls_session_t session);
```

Get currently used cipher.

session : is a [gnutls_session_t](#) structure.

Returns : the currently used cipher, a [gnutls_cipher_algorithm_t](#) type.

gnutls_kx_get ()

```
gnutls_kx_algorithm_t gnutls_kx_get (gnutls_session_t session);
```

Get currently used key exchange algorithm.

session : is a [gnutls_session_t](#) structure.

Returns : the key exchange algorithm used in the last handshake, a [gnutls_kx_algorithm_t](#) value.

gnutls_mac_get ()

```
gnutls_mac_algorithm_t gnutls_mac_get (gnutls_session_t session);
```

Get currently used MAC algorithm.

session : is a [gnutls_session_t](#) structure.

Returns : the currently used mac algorithm, a [gnutls_mac_algorithm_t](#) value.

gnutls_compression_get ()

```
gnutls_compression_method_t gnutls_compression_get (gnutls_session_t session);
```

Get currently used compression algorithm.

session : is a [gnutls_session_t](#) structure.

Returns : the currently used compression method, a [gnutls_compression_method_t](#) value.

gnutls_certificate_type_get ()

```
gnutls_certificate_type_t gnutls_certificate_type_get (gnutls_session_t session);
```

The certificate type is by default X.509, unless it is negotiated as a TLS extension.

session : is a [gnutls_session_t](#) structure.

Returns : the currently used [gnutls_certificate_type_t](#) certificate type.

gnutls_sign_algorithm_get_requested ()

```
int gnutls_sign_algorithm_get_requested (gnutls_session_t session,  
                                      size_t idx,  
                                      gnutls_sign_algorithm_t *algo);
```

Returns the signature algorithm specified by index that was requested by the peer. If the specified index has no data available this function returns [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#). If the negotiated TLS version does not support signature algorithms then [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned even for the first index. The first index is 0.

This function is useful in the certificate callback functions to assist in selecting the correct certificate.

session : is a [gnutls_session_t](#) structure.

idx : is an index of the signature algorithm to return

algo : the returned certificate type will be stored there

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

Since 2.10.0

gnutls_cipher_get_key_size ()

```
size_t gnutls_cipher_get_key_size (gnutls_cipher_algorithm_t *  
                                  algorithm);
```

Get key size for cipher.

algorithm : is an encryption algorithm

Returns : length (in bytes) of the given cipher's key size, or 0 if the given cipher is invalid.

gnutls_mac_get_key_size ()

```
size_t gnutls_mac_get_key_size (gnutls_mac_algorithm_t algorithm);
```

Get size of MAC key.

algorithm : is an encryption algorithm

Returns : length (in bytes) of the given MAC key size, or 0 if the given MAC algorithm is invalid.

gnutls_cipher_get_name ()

```
const char * gnutls_cipher_get_name (gnutls_cipher_algorithm_t *algorithm);
```

Convert a [gnutls_cipher_algorithm_t](#) type to a string.

algorithm : is an encryption algorithm

Returns : a pointer to a string that contains the name of the specified cipher, or [NULL](#).

gnutls_mac_get_name ()

```
const char * gnutls_mac_get_name (gnutls_mac_algorithm_t algorithm);
```

Convert a [gnutls_mac_algorithm_t](#) value to a string.

algorithm : is a MAC algorithm

Returns : a string that contains the name of the specified MAC algorithm, or [NULL](#).

gnutls_compression_get_name ()

```
const char * gnutls_compression_get_name (gnutls_compression_method_t *algorithm);
```

Convert a [gnutls_compression_method_t](#) value to a string.

algorithm : is a Compression algorithm

Returns : a pointer to a string that contains the name of the specified compression algorithm, or [NULL](#).

gnutls_kx_get_name ()

```
const char * gnutls_kx_get_name (gnutls_kx_algorithm_t algorithm);
```

Convert a [gnutls_kx_algorithm_t](#) value to a string.

algorithm : is a key exchange algorithm

Returns : a pointer to a string that contains the name of the specified key exchange algorithm, or [NULL](#).

gnutls_certificate_type_get_name ()

```
const char * gnutls_certificate_type_get_name (gnutls_certificate_type_t type);
```

Convert a [gnutls_certificate_type_t](#) type to a string.

type : is a certificate type

Returns : a string that contains the name of the specified certificate type, or [NULL](#) in case of unknown types.

gnutls_pk_get_name ()

```
const char * gnutls_pk_get_name (gnutls_pk_algorithm_t algorithm);
```

Convert a `gnutls_pk_algorithm_t` value to a string.

algorithm : is a public key algorithm

Returns : a pointer to a string that contains the name of the specified public key algorithm, or `NULL`.

Since 2.6.0

gnutls_sign_get_name ()

```
const char * gnutls_sign_get_name (gnutls_sign_algorithm_t algorithm) ↵ ;
```

Convert a `gnutls_sign_algorithm_t` value to a string.

algorithm : is a public key signature algorithm

Returns : a pointer to a string that contains the name of the specified public key signature algorithm, or `NULL`.

Since 2.6.0

gnutls_mac_get_id ()

```
gnutls_mac_algorithm_t gnutls_mac_get_id (const char *name);
```

Convert a string to a `gnutls_mac_algorithm_t` value. The names are compared in a case insensitive way.

name : is a MAC algorithm name

Returns : a `gnutls_mac_algorithm_t` id of the specified MAC algorithm string, or `GNUTLS_MAC_UNKNOWN` on failures.

gnutls_compression_get_id ()

```
gnutls_compression_method_t gnutls_compression_get_id (const char *name);
```

The names are compared in a case insensitive way.

name : is a compression method name

Returns : an id of the specified in a string compression method, or `GNUTLS_COMP_UNKNOWN` on error.

gnutls_cipher_get_id ()

```
gnutls_cipher_algorithm_t gnutls_cipher_get_id (const char *name);
```

The names are compared in a case insensitive way.

name : is a MAC algorithm name

Returns : return a `gnutls_cipher_algorithm_t` value corresponding to the specified cipher, or `GNUTLS_CIPHER_UNKNOWN` on error.

gnutls_kx_get_id ()

```
gnutls_kx_algorithm_t gnutls_kx_get_id (const char *name);
```

Convert a string to a [gnutls_kx_algorithm_t](#) value. The names are compared in a case insensitive way.

name : is a KX name

Returns : an id of the specified KX algorithm, or [GNUTLS_KX_UNKNOWN](#) on error.

gnutls_protocol_get_id ()

```
gnutls_protocol_t gnutls_protocol_get_id (const char *name);
```

The names are compared in a case insensitive way.

name : is a protocol name

Returns : an id of the specified protocol, or [GNUTLS_VERSION_UNKNOWN](#) on error.

gnutls_certificate_type_get_id ()

```
gnutls_certificate_type_t gnutls_certificate_type_get_id (const char *name);
```

The names are compared in a case insensitive way.

name : is a certificate type name

Returns : a [gnutls_certificate_type_t](#) for the specified in a string certificate type, or [GNUTLS_CRT_UNKNOWN](#) on error.

gnutls_pk_get_id ()

```
gnutls_pk_algorithm_t gnutls_pk_get_id (const char *name);
```

Convert a string to a [gnutls_pk_algorithm_t](#) value. The names are compared in a case insensitive way. For example, `gnutls_pk_get_id("RSA")` will return [GNUTLS_PK_RSA](#).

name : is a string containing a public key algorithm name.

Returns : a [gnutls_pk_algorithm_t](#) id of the specified public key algorithm string, or [GNUTLS_PK_UNKNOWN](#) on failures.

Since 2.6.0

gnutls_sign_get_id ()

```
gnutls_sign_algorithm_t gnutls_sign_get_id (const char *name);
```

The names are compared in a case insensitive way.

name : is a MAC algorithm name

Returns : return a [gnutls_sign_algorithm_t](#) value corresponding to the specified cipher, or [GNUTLS_SIGN_UNKNOWN](#) on error.

gnutls_cipher_list ()

```
const gnutls_cipher_algorithm_t * gnutls_cipher_list (void);
```

Get a list of supported cipher algorithms. Note that not necessarily all ciphers are supported as TLS cipher suites. For example, DES is not supported as a cipher suite, but is supported for other purposes (e.g., PKCS#8 or similar).

Returns : a zero-terminated list of [gnutls_cipher_algorithm_t](#) integers indicating the available ciphers.

gnutls_mac_list ()

```
const gnutls_mac_algorithm_t * gnutls_mac_list (void);
```

Get a list of hash algorithms for use as MACs. Note that not necessarily all MACs are supported in TLS cipher suites. For example, MD2 is not supported as a cipher suite, but is supported for other purposes (e.g., X.509 signature verification or similar).

Returns : Return a zero-terminated list of [gnutls_mac_algorithm_t](#) integers indicating the available MACs.

gnutls_compression_list ()

```
const gnutls_compression_method_t * gnutls_compression_list (void);
```

Get a list of compression methods. Note that to be able to use LZO compression, you must link to libgnutls-extra and call [gnutls_global_init_extra\(\)](#).

Returns : a zero-terminated list of [gnutls_compression_method_t](#) integers indicating the available compression methods.

gnutls_protocol_list ()

```
const gnutls_protocol_t * gnutls_protocol_list (void);
```

Get a list of supported protocols, e.g. SSL 3.0, TLS 1.0 etc.

Returns : a zero-terminated list of [gnutls_protocol_t](#) integers indicating the available protocols.

gnutls_certificate_type_list ()

```
const gnutls_certificate_type_t * gnutls_certificate_type_list (void);
```

Get a list of certificate types. Note that to be able to use OpenPGP certificates, you must link to libgnutls-extra and call [gnutls_global_init_extra\(\)](#).

Returns : a zero-terminated list of [gnutls_certificate_type_t](#) integers indicating the available certificate types.

gnutls_kx_list ()

```
const gnutls_kx_algorithm_t * gnutls_kx_list (void);
```

Get a list of supported key exchange algorithms.

Returns : a zero-terminated list of [gnutls_kx_algorithm_t](#) integers indicating the available key exchange algorithms.

gnutls_pk_list ()

```
const gnutls_pk_algorithm_t * gnutls_pk_list (void);
```

Get a list of supported public key algorithms.

Returns : a zero-terminated list of `gnutls_pk_algorithm_t` integers indicating the available ciphers.

Since 2.6.0

gnutls_sign_list ()

```
const gnutls_sign_algorithm_t * gnutls_sign_list (void);
```

Get a list of supported public key signature algorithms.

Returns : a zero-terminated list of `gnutls_sign_algorithm_t` integers indicating the available ciphers.

gnutls_cipher_suite_info ()

```
const char * gnutls_cipher_suite_info (size_t idx,
                                      char *cs_id,
                                      gnutls_kx_algorithm_t *kx,
                                      gnutls_cipher_algorithm_t *cipher,
                                      gnutls_mac_algorithm_t *mac,
                                      gnutls_protocol_t *version);
```

Get information about supported cipher suites. Use the function iteratively to get information about all supported cipher suites. Call with `idx=0` to get information about first cipher suite, then `idx=1` and so on until the function returns `NULL`.

idx : index of cipher suite to get information about, starts on 0.

cs_id : output buffer with room for 2 bytes, indicating cipher suite value

kx : output variable indicating key exchange algorithm, or `NULL`.

cipher : output variable indicating cipher, or `NULL`.

mac : output variable indicating MAC algorithm, or `NULL`.

version : output variable indicating TLS protocol version, or `NULL`.

Returns : the name of `idx` cipher suite, and set the information about the cipher suite in the output variables. If `idx` is out of bounds, `NULL` is returned.

gnutls_error_is_fatal ()

```
int gnutls_error_is_fatal (int error);
```

If a GnuTLS function returns a negative value you may feed that value to this function to see if the error condition is fatal.

Note that you may want to check the error code manually, since some non-fatal errors to the protocol may be fatal for your program.

This function is only useful if you are dealing with errors from the record layer or the handshake layer.

error : is a GnuTLS error code, a negative value

Returns : 1 if the error code is fatal, for positive `error` values, 0 is returned. For unknown `error` values, -1 is returned.

gnutls_error_to_alert ()

```
int gnutls_error_to_alert (int err,  
                           int *level);
```

Get an alert depending on the error code returned by a gnutls function. All alerts sent by this function should be considered fatal. The only exception is when `err` is **GNUTLS_E_REHANDSHAKE**, where a warning alert should be sent to the peer indicating that no renegotiation will be performed.

If there is no mapping to a valid alert the alert to indicate internal error is returned.

err : is a negative integer

level : the alert level will be stored there

Returns : the alert code to use for a particular error code.

gnutls_perror ()

```
void gnutls_perror (int error);
```

This function is like **perror()**. The only difference is that it accepts an error number returned by a gnutls function.

error : is a GnuTLS error code, a negative value

gnutls_strerror ()

```
const char * gnutls_strerror (int error);
```

This function is similar to **strerror**. The difference is that it accepts an error number returned by a gnutls function; In case of an unknown error a descriptive string is sent instead of **NULL**.

Error codes are always a negative value.

error : is a GnuTLS error code, a negative value

Returns : A string explaining the GnuTLS error message.

gnutls_strerror_name ()

```
const char * gnutls_strerror_name (int error);
```

Return the GnuTLS error code define as a string. For example, `gnutls_strerror_name (GNUTLS_E_DH_PRIME_UNACCEPTABLE)` will return the string "GNUTLS_E_DH_PRIME_UNACCEPTABLE".

error : is an error returned by a gnutls function.

Returns : A string corresponding to the symbol name of the error code.

Since 2.6.0

gnutls_handshake_set_private_extensions ()

```
void gnutls_handshake_set_private_extensions
      (gnutls_session_t session,
       int allow);
```

This function will enable or disable the use of private cipher suites (the ones that start with 0xFF). By default or if *allow* is 0 then these cipher suites will not be advertized nor used.

Unless this function is called with the option to allow (1), then no compression algorithms, like LZO. That is because these algorithms are not yet defined in any RFC or even internet draft.

Enabling the private ciphersuites when talking to other than gnutls servers and clients may cause interoperability problems.

session : is a [gnutls_session_t](#) structure.

allow : is an integer (0 or 1)

gnutls_handshake_get_last_out ()

```
gnutls_handshake_description_t gnutls_handshake_get_last_out
                               (gnutls_session_t session);
```

This function is only useful to check where the last performed handshake failed. If the previous handshake succeed or was not performed at all then no meaningful value will be returned.

Check [gnutls_handshake_description_t](#) in gnutls.h for the available handshake descriptions.

session : is a [gnutls_session_t](#) structure.

Returns : the last handshake message type sent, a [gnutls_handshake_description_t](#).

gnutls_handshake_get_last_in ()

```
gnutls_handshake_description_t gnutls_handshake_get_last_in
                               (gnutls_session_t session);
```

This function is only useful to check where the last performed handshake failed. If the previous handshake succeed or was not performed at all then no meaningful value will be returned.

Check [gnutls_handshake_description_t](#) in gnutls.h for the available handshake descriptions.

session : is a [gnutls_session_t](#) structure.

Returns : the last handshake message type received, a [gnutls_handshake_description_t](#).

gnutls_record_send ()

```
ssize_t gnutls_record_send
        (gnutls_session_t session,
         const void *data,
         size_t sizeofdata);
```

This function has the similar semantics with [send\(\)](#). The only difference is that it accepts a GnuTLS session, and uses different error codes.

Note that if the send buffer is full, [send\(\)](#) will block this function. See the [send\(\)](#) documentation for full information. You can replace the default push function by using [gnutls_transport_set_ptr2\(\)](#) with a call to [send\(\)](#) with a MSG_DONTWAIT flag if blocking is a problem.

If the EINTR is returned by the internal push function (the default is [send\(\)](#)) then [GNUTLS_E_INTERRUPTED](#) will be returned. If [GNUTLS_E_INTERRUPTED](#) or [GNUTLS_E AGAIN](#) is returned, you must call this function again, with the same parameters; alternatively you could provide a **NULL** pointer for data, and 0 for size. cf. [gnutls_record_get_direction\(\)](#).

session : is a `gnutls_session_t` structure.

data : contains the data to send

sizeofdata : is the length of the data

Returns : the number of bytes sent, or a negative error code. The number of bytes sent might be less than `sizeofdata`. The maximum number of bytes this function can send in a single call depends on the negotiated maximum record size.

`gnutls_record_recv ()`

<code>ssize_t</code>	<code>gnutls_record_recv</code>	<code>(gnutls_session_t session,</code>
		<code>void *data,</code>
		<code>size_t sizeofdata);</code>

This function has the similar semantics with `recv()`. The only difference is that it accepts a GnuTLS session, and uses different error codes.

In the special case that a server requests a renegotiation, the client may receive an error code of `GNUTLS_E_REHANDSHAKE`. This message may be simply ignored, replied with an alert `GNUTLS_A_NO_RENEGOTIATION`, or replied with a new handshake, depending on the client's will.

If `EINTR` is returned by the internal push function (the default is `recv()`) then `GNUTLS_E_INTERRUPTED` will be returned. If `GNUTLS_E_INTERRUPTED` or `GNUTLS_E AGAIN` is returned, you must call this function again to get the data. See also `gnutls_record_get_direction()`.

A server may also receive `GNUTLS_E_REHANDSHAKE` when a client has initiated a handshake. In that case the server can only initiate a handshake or terminate the connection.

session : is a `gnutls_session_t` structure.

data : the buffer that the data will be read into

sizeofdata : the number of requested bytes

Returns : the number of bytes received and zero on EOF. A negative error code is returned in case of an error. The number of bytes received might be less than `sizeofdata`.

`gnutls_read`

```
#define gnutls_read gnutls_record_recv
```

`gnutls_write`

```
#define gnutls_write gnutls_record_send
```

`gnutls_session_enable_compatibility_mode ()`

<code>void</code>	<code>gnutls_session_enable_compatibility_mode</code>	<code>(gnutls_session_t session);</code>
-------------------	---	--

This function can be used to disable certain (security) features in TLS in order to maintain maximum compatibility with buggy clients. It is equivalent to calling: `gnutls_record_disable_padding()`

Normally only servers that require maximum compatibility with everything out there, need to call this function.

session : is a `gnutls_session_t` structure.

gnutls_record_disable_padding ()

```
void gnutls_record_disable_padding (gnutls_session_t session);
```

Used to disabled padding in TLS 1.0 and above. Normally you do not need to use this function, but there are buggy clients that complain if a server pads the encrypted data. This of course will disable protection against statistical attacks on the data.

Normally only servers that require maximum compatibility with everything out there, need to call this function.

session : is a `gnutls_session_t` structure.

gnutls_record_get_direction ()

```
int gnutls_record_get_direction (gnutls_session_t session);
```

This function provides information about the internals of the record protocol and is only useful if a prior gnutls function call (e.g. `gnutls_handshake()`) was interrupted for some reason, that is, if a function returned `GNUTLS_E_INTERRUPTED` or `GNUTLS_E AGAIN`. In such a case, you might want to call `select()` or `poll()` before calling the interrupted gnutls function again. To tell you whether a file descriptor should be selected for either reading or writing, `gnutls_record_get_direction()` returns 0 if the interrupted function was trying to read data, and 1 if it was trying to write data.

session : is a `gnutls_session_t` structure.

Returns : 0 if trying to read data, 1 if trying to write data.

gnutls_record_get_max_size ()

```
size_t gnutls_record_get_max_size (gnutls_session_t session);
```

Get the record size. The maximum record size is negotiated by the client after the first handshake message.

session : is a `gnutls_session_t` structure.

Returns : The maximum record packet size in this connection.

gnutls_record_set_max_size ()

```
ssize_t gnutls_record_set_max_size (gnutls_session_t session,  
size_t size);
```

This function sets the maximum record packet size in this connection. This property can only be set to clients. The server may choose not to accept the requested size.

Acceptable values are 512(= 2^9), 1024(= 2^{10}), 2048(= 2^{11}) and 4096(= 2^{12}). The requested record size does get in effect immediately only while sending data. The receive part will take effect after a successful handshake.

This function uses a TLS extension called 'max record size'. Not all TLS implementations use or even understand this extension.

session : is a `gnutls_session_t` structure.

size : is the new size

Returns : On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_record_check_pending ()

size_t	gnutls_record_check_pending	(gnutls_session_t session);
--------	-----------------------------	-----------------------------

This function checks if there are any data to receive in the gnutls buffers.

Note that you could also use [select\(\)](#) to check for data in a TCP connection, instead of this function. GnuTLS leaves some data in the tcp buffer in order for select to work. However the [select\(\)](#) alternative is not recommended and will be deprecated in later GnuTLS revisions.

session : is a [gnutls_session_t](#) structure.

Returns : the size of that data or 0.

gnutls_prf ()

int	gnutls_prf	(gnutls_session_t session, size_t label_size, const char *label, int server_random_first, size_t extra_size, const char *extra, size_t outsize, char *out);
-----	------------	--

Apply the TLS Pseudo-Random-Function (PRF) using the master secret on some data, seeded with the client and server random fields.

The *label* variable usually contain a string denoting the purpose for the generated data. The *server_random_first* indicate whether the client random field or the server random field should be first in the seed. Non-0 indicate that the server random field is first, 0 that the client random field is first.

The *extra* variable can be used to add more data to the seed, after the random variables. It can be used to tie make sure the generated output is strongly connected to some additional data (e.g., a string used in user authentication).

The output is placed in **OUT*, which must be pre-allocated.

session : is a [gnutls_session_t](#) structure.

label_size : length of the *label* variable.

label : label used in PRF computation, typically a short string.

server_random_first : non-0 if server random field should be first in seed

extra_size : length of the *extra* variable.

extra : optional extra data to seed the PRF with.

outsize : size of pre-allocated output buffer to hold the output.

out : pre-allocate buffer to hold the generated data.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_prf_raw ()

```
int gnutls_prf_raw(gnutls_session_t session,
                   size_t label_size,
                   const char *label,
                   size_t seed_size,
                   const char *seed,
                   size_t outsize,
                   char *out);
```

Apply the TLS Pseudo-Random-Function (PRF) using the master secret on some data.

The *label* variable usually contain a string denoting the purpose for the generated data. The *seed* usually contain data such as the client and server random, perhaps together with some additional data that is added to guarantee uniqueness of the output for a particular purpose.

Because the output is not guaranteed to be unique for a particular session unless *seed* include the client random and server random fields (the PRF would output the same data on another connection resumed from the first one), it is not recommended to use this function directly. The [gnutls_prf\(\)](#) function seed the PRF with the client and server random fields directly, and is recommended if you want to generate pseudo random data unique for each session.

session : is a [gnutls_session_t](#) structure.

label_size : length of the *label* variable.

label : label used in PRF computation, typically a short string.

seed_size : length of the *seed* variable.

seed : optional extra data to seed the PRF with.

outsize : size of pre-allocated output buffer to hold the output.

out : pre-allocate buffer to hold the generated data.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_ext_recv_func ()

```
int (*gnutls_ext_recv_func)(gnutls_session_t session,
                           unsigned char *data,
                           size_t len);
```

session :

data :

len :

Returns :

gnutls_ext_send_func ()

```
int (*gnutls_ext_send_func)(gnutls_session_t session,
                           unsigned char *data,
                           size_t len);
```

session :

data :

len :

Returns :

enum gnutls_ext_parse_type_t

```
typedef enum
{
    GNUTLS_EXT_ANY = 0,
    GNUTLS_EXT_APPLICATION = 1,
    GNUTLS_EXT_TLS = 2,
    GNUTLS_EXT_MANDATORY = 3,
    GNUTLS_EXT_NONE = 4
} gnutls_ext_parse_type_t;
```

Enumeration of different TLS extension types. This flag indicates for an extension whether it is useful to application level or TLS level only. This is (only) used to parse the application level extensions before the "client_hello" callback is called.

GNUTLS_EXT_ANY Any extension type.

GNUTLS_EXT_APPLICATION Application extension.

GNUTLS_EXT_TLS TLS-internal extension.

GNUTLS_EXT_MANDATORY Extension parsed even if resuming (or extensions are disabled).

GNUTLS_EXT_NONE Never parsed

enum gnutls_server_name_type_t

```
typedef enum
{
    GNUTLS_NAME_DNS = 1
} gnutls_server_name_type_t;
```

Enumeration of different server name types.

GNUTLS_NAME_DNS Domain Name System name type.

gnutls_server_name_set ()

int	gnutls_server_name_set	(gnutls_session_t session,
		gnutls_server_name_type_t type,
		const void *name,
		size_t name_length);

This function is to be used by clients that want to inform (via a TLS extension mechanism) the server of the name they connected to. This should be used by clients that connect to servers that do virtual hosting.

The value of *name* depends on the *type* type. In case of **GNUTLS_NAME_DNS**, an ASCII zero-terminated domain name string, without the trailing dot, is expected. IPv4 or IPv6 addresses are not permitted.

session : is a **gnutls_session_t** structure.

type : specifies the indicator type

name : is a string that contains the server name.

name_length : holds the length of name

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_server_name_get ()

```
int gnutls_server_name_get (gnutls_session_t session,
                           void *data,
                           size_t *data_length,
                           unsigned int *type,
                           unsigned int indx);
```

This function will allow you to get the name indication (if any), a client has sent. The name indication may be any of the enumeration `gnutls_server_name_type_t`.

If `type` is `GNUTLS_NAME_DNS`, then this function is to be used by servers that support virtual hosting, and the data will be a null terminated UTF-8 string.

If `data` has not enough size to hold the server name `GNUTLS_E_SHORT_MEMORY_BUFFER` is returned, and `data_length` will hold the required size.

`index` is used to retrieve more than one server names (if sent by the client). The first server name has an index of 0, the second 1 and so on. If no name with the given index exists `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` is returned.

session : is a `gnutls_session_t` structure.

data : will hold the data

data_length : will hold the data length. Must hold the maximum size of data.

type : will hold the server name indicator type

indx : is the index of the server_name

Returns : On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_safe_renegotiation_status ()

```
int gnutls_safe_renegotiation_status (gnutls_session_t session);
```

Can be used to check whether safe renegotiation is being used in the current session.

session : is a `gnutls_session_t` structure.

Returns : 0 when safe renegotiation is not used and non zero when safe renegotiation is used.

Since 2.10.0

enum gnutls_supplemental_data_format_type_t

```
typedef enum
{
    GNUTLS_SUPPLEMENTAL_USER_MAPPING_DATA = 0
} gnutls_supplemental_data_format_type_t;
```

Enumeration of different supplemental data types (RFC 4680).

GNUTLS_SUPPLEMENTAL_USER_MAPPING_DATA Supplemental user mapping data.

gnutls_session_ticket_key_generate ()

```
int gnutls_session_ticket_key_generate (gnutls_datum_t *key);
```

Generate a random key to encrypt security parameters within SessionTicket.

key : is a pointer to a [gnutls_datum_t](#) which will contain a newly created key.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

Since 2.10.0

gnutls_session_ticket_enable_client ()

```
int gnutls_session_ticket_enable_client (gnutls_session_t session);
```

Request that the client should attempt session resumption using SessionTicket.

session : is a [gnutls_session_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

Since 2.10.0

gnutls_session_ticket_enable_server ()

```
int gnutls_session_ticket_enable_server (gnutls_session_t session,
                                         const gnutls_datum_t *key);
```

Request that the server should attempt session resumption using SessionTicket. *key* must be initialized with [gnutls_session_ticket_key_generate\(\)](#).

session : is a [gnutls_session_t](#) structure.

key : key to encrypt session parameters.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

Since 2.10.0

gnutls_cipher_set_priority ()

```
int gnutls_cipher_set_priority (gnutls_session_t session,
                               const int *list);
```

Sets the priority on the ciphers supported by gnutls. Priority is higher for elements specified before others. After specifying the ciphers you want, you must append a 0. Note that the priority is set on the client. The server does not use the algorithm's priority except for disabling algorithms that were not specified.

session : is a [gnutls_session_t](#) structure.

list : is a 0 terminated list of [gnutls_cipher_algorithm_t](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_mac_set_priority ()

```
int gnutls_mac_set_priority (gnutls_session_t session,
                           const int *list);
```

Sets the priority on the mac algorithms supported by gnutls. Priority is higher for elements specified before others. After specifying the algorithms you want, you must append a 0. Note that the priority is set on the client. The server does not use the algorithm's priority except for disabling algorithms that were not specified.

session : is a [gnutls_session_t](#) structure.

list : is a 0 terminated list of [gnutls_mac_algorithm_t](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_compression_set_priority ()

```
int gnutls_compression_set_priority (gnutls_session_t session,
                                    const int *list);
```

Sets the priority on the compression algorithms supported by gnutls. Priority is higher for elements specified before others. After specifying the algorithms you want, you must append a 0. Note that the priority is set on the client. The server does not use the algorithm's priority except for disabling algorithms that were not specified.

TLS 1.0 does not define any compression algorithms except NULL. Other compression algorithms are to be considered as gnutls extensions.

session : is a [gnutls_session_t](#) structure.

list : is a 0 terminated list of [gnutls_compression_method_t](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_kx_set_priority ()

```
int gnutls_kx_set_priority (gnutls_session_t session,
                           const int *list);
```

Sets the priority on the key exchange algorithms supported by gnutls. Priority is higher for elements specified before others. After specifying the algorithms you want, you must append a 0. Note that the priority is set on the client. The server does not use the algorithm's priority except for disabling algorithms that were not specified.

session : is a [gnutls_session_t](#) structure.

list : is a 0 terminated list of [gnutls_kx_algorithm_t](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_protocol_set_priority ()

```
int gnutls_protocol_set_priority (gnutls_session_t session,
                                 const int *list);
```

Sets the priority on the protocol versions supported by gnutls. This function actually enables or disables protocols. Newer protocol versions always have highest priority.

session : is a [gnutls_session_t](#) structure.

list : is a 0 terminated list of [gnutls_protocol_t](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_certificate_type_set_priority ()

```
int gnutls_certificate_type_set_priority
      (gnutls_session_t session,
       const int *list);
```

Sets the priority on the certificate types supported by gnutls. Priority is higher for elements specified before others. After specifying the types you want, you must append a 0. Note that the certificate type priority is set on the client. The server does not use the cert type priority except for disabling types that were not specified.

session : is a `gnutls_session_t` structure.

list : is a 0 terminated list of `gnutls_certificate_type_t` elements.

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_priority_init ()

```
int gnutls_priority_init
      (gnutls_priority_t *priority_cache,
       const char *priorities,
       const char **err_pos);
```

Sets priorities for the ciphers, key exchange methods, macs and compression methods. This is to avoid using the `gnutls_*_priority()` functions.

The **priorities** option allows you to specify a colon separated list of the cipher priorities to enable.

Unless the first keyword is "NONE" the defaults (in preference order) are for TLS protocols TLS 1.2, TLS1.1, TLS1.0, SSL3.0; for compression NULL; for certificate types X.509, OpenPGP.

For key exchange algorithms when in NORMAL or SECURE levels the perfect forward secrecy algorithms take precedence of the other protocols. In all cases all the supported key exchange algorithms are enabled (except for the RSA-EXPORT which is only enabled in EXPORT level).

Note that although one can select very long key sizes (such as 256 bits) for symmetric algorithms, to actually increase security the public key algorithms have to use longer key sizes as well.

For all the current available algorithms and protocols use "gnutls-cli -l" to get a listing.

Common keywords: Some keywords are defined to provide quick access to common preferences.

"PERFORMANCE" means all the "secure" ciphersuites are enabled, limited to 128 bit ciphers and sorted by terms of speed performance.

"NORMAL" means all "secure" ciphersuites. The 256-bit ciphers are included as a fallback only. The ciphers are sorted by security margin.

"SECURE128" means all "secure" ciphersuites with ciphers up to 128 bits, sorted by security margin.

"SECURE256" means all "secure" ciphersuites including the 256 bit ciphers, sorted by security margin.

"EXPORT" means all ciphersuites are enabled, including the low-security 40 bit ciphers.

"NONE" means nothing is enabled. This disables even protocols and compression methods.

Special keywords: "!" or "-" appended with an algorithm will remove this algorithm.

"+" appended with an algorithm will add this algorithm.

"COMPAT" will enable compatibility features for a server.

"DISABLE_SAFE_RENEGOTIATION" will disable safe renegotiation completely. Do not use unless you know what you are doing. Testing purposes only.

"**UNSAFE_RENEGOTIATION**" will allow handshakes and rehandshakes without the safe renegotiation extension. Note that for clients this mode is insecure (you may be under attack), and for servers it will allow insecure clients to connect (which could be fooled by an attacker). Do not use unless you know what you are doing and want maximum compatibility.

"**PARTIAL_RENEGOTIATION**" will allow initial handshakes to proceed, but not rehandshakes. This leaves the client vulnerable to attack, and servers will be compatible with non-upgraded clients for initial handshakes. This is currently the default for clients and servers, for compatibility reasons.

"**SAFE_RENEGOTIATION**" will enforce safe renegotiation. Clients and servers will refuse to talk to an insecure peer. Currently this causes operability problems, but is required for full protection.

"**SSL3_RECORD_VERSION**" will use SSL3.0 record version in client hello. This is the default.

"**LATEST_RECORD_VERSION**" will use the latest TLS version record version in client hello.

"**VERIFY_ALLOW_SIGN_RSA_MD5**" will allow RSA-MD5 signatures in certificate chains.

"**VERIFY_ALLOW_X509_V1_CA_CRT**" will allow V1 CAs in chains.

Namespace concern: To avoid collisions in order to specify a compression algorithm in this string you have to prefix it with "COMP-", protocol versions with "VERS-", signature algorithms with "SIGN-" and certificate types with "CTYPE-". All other algorithms don't need a prefix. The keywords "SIGN-ALL", "CTYPE-ALL", "COMP-ALL", and "VERS-TLS-ALL" can be used to add all the support signature types, certificate types, compression methods and supported TLS version numbers.

Examples: "NORMAL:!AES-128-CBC" means normal ciphers except for AES-128.

"EXPORT:!VERS-TLS1.0:+COMP-DEFLATE" means that export ciphers are enabled, TLS 1.0 is disabled, and libz compression enabled.

"NONE:+VERS-TLS-ALL:+AES-128-CBC:+RSA:+SHA1:+COMP-NULL:+SIGN-RSA-SHA1", "NORMAL", "**COMPAT**".

priority_cache : is a `gnutls_priority_t` structure.

priorities : is a string describing priorities

err_pos : In case of an error this will have the position in the string the error occurred

Returns : On syntax error `GNUTLS_E_INVALID_REQUEST` is returned, `GNUTLS_E_SUCCESS` on success, or an error code.

`gnutls_priority_deinit ()`

<code>void</code>	<code>gnutls_priority_deinit</code>	<code>(gnutls_priority_t priority_cache);</code>
-------------------	-------------------------------------	--

Deinitializes the priority cache.

priority_cache : is a `gnutls_priority_t` structure.

`gnutls_priority_set ()`

<code>int</code>	<code>gnutls_priority_set</code>	<code>(gnutls_session_t session,</code>
		<code>gnutls_priority_t priority);</code>

Sets the priorities to use on the ciphers, key exchange methods, macs and compression methods.

session : is a `gnutls_session_t` structure.

priority : is a `gnutls_priority_t` structure.

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_priority_set_direct ()

```
int gnutls_priority_set_direct (gnutls_session_t session,
                               const char *priorities,
                               const char **err_pos);
```

Sets the priorities to use on the ciphers, key exchange methods, macs and compression methods. This function avoids keeping a priority cache and is used to directly set string priorities to a TLS session. For documentation check the [gnutls_priority_init\(\)](#).

session : is a [gnutls_session_t](#) structure.

priorities : is a string describing priorities

err_pos : In case of an error this will have the position in the string the error occurred

Returns : On syntax error [GNUTLS_E_INVALID_REQUEST](#) is returned, [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_set_default_priority ()

```
int gnutls_set_default_priority (gnutls_session_t session);
```

Sets some default priority on the ciphers, key exchange methods, macs and compression methods.

This is the same as calling:

```
gnutls_priority_set_direct (session, "NORMAL", NULL);
```

This function is kept around for backwards compatibility, but because of its wide use it is still fully supported. If you wish to allow users to provide a string that specify which ciphers to use (which is recommended), you should use [gnutls_priority_set_direct\(\)](#) or [gnutls_priority_set\(\)](#) instead.

session : is a [gnutls_session_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_set_default_export_priority ()

```
int gnutls_set_default_export_priority (gnutls_session_t session);
```

Sets some default priority on the ciphers, key exchange methods, macs and compression methods. This function also includes weak algorithms.

This is the same as calling:

```
gnutls_priority_set_direct (session, "EXPORT", NULL);
```

This function is kept around for backwards compatibility, but because of its wide use it is still fully supported. If you wish to allow users to provide a string that specify which ciphers to use (which is recommended), you should use [gnutls_priority_set_direct\(\)](#) or [gnutls_priority_set\(\)](#) instead.

session : is a [gnutls_session_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_cipher_suite_get_name ()

```
const char * gnutls_cipher_suite_get_name (gnutls_kx_algorithm_t kx_algorithm ←
                                         ,
                                         gnutls_cipher_algorithm_t cipher_algorithm,
                                         gnutls_mac_algorithm_t mac_algorithm);
```

Note that the full cipher suite name must be prepended by TLS or SSL depending of the protocol in use.

kx_algorithm : is a Key exchange algorithm

cipher_algorithm : is a cipher algorithm

mac_algorithm : is a MAC algorithm

Returns : a string that contains the name of a TLS cipher suite, specified by the given algorithms, or **NULL**.

gnutls_protocol_get_version ()

```
gnutls_protocol_t gnutls_protocol_get_version (gnutls_session_t session);
```

Get TLS version, a **gnutls_protocol_t** value.

session : is a **gnutls_session_t** structure.

Returns : the version of the currently used protocol.

gnutls_protocol_get_name ()

```
const char * gnutls_protocol_get_name (gnutls_protocol_t version);
```

Convert a **gnutls_protocol_t** value to a string.

version : is a (gnutls) version number

Returns : a string that contains the name of the specified TLS version (e.g., "TLS1.0"), or **NULL**.

gnutls_session_set_data ()

```
int gnutls_session_set_data (gnutls_session_t session,
                           const void *session_data,
                           size_t session_data_size);
```

Sets all session parameters, in order to resume a previously established session. The session data given must be the one returned by **gnutls_session_get_data()**. This function should be called before **gnutls_handshake()**.

Keep in mind that session resuming is advisory. The server may choose not to resume the session, thus a full handshake will be performed.

session : is a **gnutls_session_t** structure.

session_data : is a pointer to space to hold the session.

session_data_size : is the session's size

Returns : On success, **GNUTLS_E_SUCCESS** (0) is returned, otherwise an error code is returned.

gnutls_session_get_data()

```
int gnutls_session_get_data (gnutls_session_t session,
                           void *session_data,
                           size_t *session_data_size);
```

Returns all session parameters, in order to support resuming. The client should call this, and keep the returned session, if he wants to resume that current version later by calling [gnutls_session_set_data\(\)](#). This function must be called after a successful handshake.

Resuming sessions is really useful and speedups connections after a successful one.

session : is a [gnutls_session_t](#) structure.

session_data : is a pointer to space to hold the session.

session_data_size : is the session_data's size, or it will be set by the function.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_session_get_data2()

```
int gnutls_session_get_data2 (gnutls_session_t session,
                            gnutls_datum_t *data);
```

Returns all session parameters, in order to support resuming. The client should call this, and keep the returned session, if he wants to resume that current version later by calling [gnutls_session_set_data\(\)](#). This function must be called after a successful handshake. The returned datum must be freed with [gnutls_free\(\)](#).

Resuming sessions is really useful and speedups connections after a successful one.

session : is a [gnutls_session_t](#) structure.

data : is a pointer to a datum that will hold the session.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

GNUTLS_MAX_SESSION_ID

```
#define GNUTLS_MAX_SESSION_ID 32
```

gnutls_session_get_id()

```
int gnutls_session_get_id (gnutls_session_t session,
                          void *session_id,
                          size_t *session_id_size);
```

Returns the current session id. This can be used if you want to check if the next session you tried to resume was actually resumed. This is because resumed sessions have the same sessionID with the original session.

Session id is some data set by the server, that identify the current session. In TLS 1.0 and SSL 3.0 session id is always less than 32 bytes.

session : is a [gnutls_session_t](#) structure.

session_id : is a pointer to space to hold the session id.

session_id_size : is the session id's size, or it will be set by the function.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_session_channel_binding ()

```
int gnutls_session_channel_binding (gnutls_session_t session,
                                  gnutls_channel_binding_t cbtype,
                                  gnutls_datum_t *cb);
```

Extract given channel binding data of the *cbtype* (e.g., **GNUTLS_CB_TLS_UNIQUE**) type.

session : is a [gnutls_session_t](#) structure.

cbtype : an [gnutls_channel_binding_t](#) enumeration type

cb : output buffer array with data

Returns : **GNUTLS_E_SUCCESS** on success, **GNUTLS_E_UNIMPLEMENTED_FEATURE** if the *cbtype* is unsupported, **GNUTLS_E_CHANNEL_BINDING_NOT_AVAILABLE** if the data is not currently available, or an error code.

Since 2.12.0

gnutls_session_is_resumed ()

```
int gnutls_session_is_resumed (gnutls_session_t session);
```

Check whether session is resumed or not.

session : is a [gnutls_session_t](#) structure.

Returns : non zero if this session is resumed, or a zero if this is a new session.

gnutls_db_store_func ()

```
int (*gnutls_db_store_func) (void *Param1,
                           gnutls_datum_t key,
                           gnutls_datum_t data);
```

Param1 :

key :

data :

Returns :

gnutls_db_remove_func ()

```
int (*gnutls_db_remove_func) (void *Param1,
                            gnutls_datum_t key);
```

Param1 :

key :

Returns :

gnutls_db_retr_func ()

```
gnutls_datum_t      (*gnutls_db_retr_func)
                    (void *Param1,
                     gnutls_datum_t key);
```

Param1 :

key :

Returns :

gnutls_db_set_cache_expiration ()

```
void             gnutls_db_set_cache_expiration
                (gnutls_session_t session,
                 int seconds);
```

Set the expiration time for resumed sessions. The default is 3600 (one hour) at the time writing this.

session : is a [gnutls_session_t](#) structure.

seconds : is the number of seconds.

gnutls_db_remove_session ()

```
void             gnutls_db_remove_session
                (gnutls_session_t session);
```

This function will remove the current session data from the session database. This will prevent future handshakes reusing these session data. This function should be called if a session was terminated abnormally, and before [gnutls_deinit\(\)](#) is called.

Normally [gnutls_deinit\(\)](#) will remove abnormally terminated sessions.

session : is a [gnutls_session_t](#) structure.

gnutls_db_set_retrieve_function ()

```
void             gnutls_db_set_retrieve_function
                (gnutls_session_t session,
                 gnutls_db_retr_func retr_func);
```

Sets the function that will be used to retrieve data from the resumed sessions database. This function must return a [gnutls_datum_t](#) containing the data on success, or a [gnutls_datum_t](#) containing null and 0 on failure.

The datum's data must be allocated using the function [gnutls_malloc\(\)](#).

The first argument to *retr_func* will be null unless [gnutls_db_set_ptr\(\)](#) has been called.

session : is a [gnutls_session_t](#) structure.

retr_func : is the function.

gnutls_db_set_remove_function ()

```
void             gnutls_db_set_remove_function
                (gnutls_session_t session,
                 gnutls_db_remove_func rem_func);
```

Sets the function that will be used to remove data from the resumed sessions database. This function must return 0 on success.

The first argument to *rem_func* will be null unless [gnutls_db_set_ptr\(\)](#) has been called.

session : is a [gnutls_session_t](#) structure.

rem_func : is the function.

gnutls_db_set_store_function ()

```
void gnutls_db_set_store_function (gnutls_session_t session,
                                 gnutls_db_store_func store_func);
```

Sets the function that will be used to store data from the resumed sessions database. This function must return 0 on success.

The first argument to `store_func()` will be null unless `gnutls_db_set_ptr()` has been called.

session : is a `gnutls_session_t` structure.

store_func : is the function

gnutls_db_set_ptr ()

```
void gnutls_db_set_ptr (gnutls_session_t session,
                       void *ptr);
```

Sets the pointer that will be provided to db store, retrieve and delete functions, as the first argument.

session : is a `gnutls_session_t` structure.

ptr : is the pointer

gnutls_db_get_ptr ()

```
void * gnutls_db_get_ptr (gnutls_session_t session);
```

Get db function pointer.

session : is a `gnutls_session_t` structure.

Returns : the pointer that will be sent to db store, retrieve and delete functions, as the first argument.

gnutls_db_check_entry ()

```
int gnutls_db_check_entry (gnutls_session_t session,
                           gnutls_datum_t session_entry);
```

Check if database entry has expired. This function is to be used when you want to clear unnecessary session which occupy space in your backend.

session : is a `gnutls_session_t` structure.

session_entry : is the session data (not key)

Returns : Returns `GNUTLS_E_EXPIRED`, if the database entry has expired or 0 otherwise.

gnutls_handshake_post_client_hello_func ()

```
int (*gnutls_handshake_post_client_hello_func)
      (gnutls_session_t Param1);
```

Param1 :

Returns :

gnutls_handshake_set_post_client_hello_function ()

```
void gnutls_handshake_set_post_client_hello_function
(gnutls_session_t session,
gnutls_handshake_post_client_hello_func ←
func);
```

This function will set a callback to be called after the client hello has been received (callback valid in server side only). This allows the server to adjust settings based on received extensions.

Those settings could be ciphersuites, requesting certificate, or anything else except for version negotiation (this is done before the hello message is parsed).

This callback must return 0 on success or a gnutls error code to terminate the handshake.

Warning: You should not use this function to terminate the handshake based on client input unless you know what you are doing. Before the handshake is finished there is no way to know if there is a man-in-the-middle attack being performed.

session : is a [gnutls_session_t](#) structure.

func : is the function to be called

gnutls_handshake_set_max_packet_length ()

```
void gnutls_handshake_set_max_packet_length
(gnutls_session_t session,
size_t max);
```

This function will set the maximum size of all handshake messages. Handshakes over this size are rejected with [GNUTLS_E_HANDSHAKE_TOO_LARGE](#) error code. The default value is 48kb which is typically large enough. Set this to 0 if you do not want to set an upper limit.

The reason for restricting the handshake message sizes are to limit Denial of Service attacks.

session : is a [gnutls_session_t](#) structure.

max : is the maximum number.

gnutls_check_version ()

```
const char * gnutls_check_version (const char *req_version);
```

Check GnuTLS Library version.

See [GNUTLS_VERSION](#) for a suitable *req_version* string.

req_version : version string to compare with, or [NULL](#).

Returns : Check that the version of the library is at minimum the one given as a string in *req_version* and return the actual version string of the library; return [NULL](#) if the condition is not met. If [NULL](#) is passed to this function no check is done and only the version string is returned.

gnutls_credentials_clear ()

```
void gnutls_credentials_clear (gnutls_session_t session);
```

Clears all the credentials previously set in this session.

session : is a [gnutls_session_t](#) structure.

gnutls_credentials_set ()

```
int gnutls_credentials_set (gnutls_session_t session,
                           gnutls_credentials_type_t type,
                           void *cred);
```

Sets the needed credentials for the specified type. Eg username, password - or public and private keys etc. The *cred* parameter is a structure that depends on the specified type and on the current session (client or server).

In order to minimize memory usage, and share credentials between several threads gnutls keeps a pointer to cred, and not the whole cred structure. Thus you will have to keep the structure allocated until you call [gnutls_deinit\(\)](#).

For [GNUTLS_CRD_ANON](#), *cred* should be [gnutls_anon_client_credentials_t](#) in case of a client. In case of a server it should be [gnutls_anon_server_credentials_t](#).

For [GNUTLS_CRD_SRP](#), *cred* should be [gnutls_srp_client_credentials_t](#) in case of a client, and [gnutls_srp_server_credentials_t](#), in case of a server.

For [GNUTLS_CRD_CERTIFICATE](#), *cred* should be [gnutls_certificate_credentials_t](#).

session : is a [gnutls_session_t](#) structure.

type : is the type of the credentials

cred : is a pointer to a structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_cred_set

```
#define gnutls_cred_set~gnutls_credentials_set
```

struct gnutls_certificate_credentials_st

```
struct gnutls_certificate_credentials_st;
```

gnutls_anon_free_server_credentials ()

```
void gnutls_anon_free_server_credentials (gnutls_anon_server_credentials_t * ←
                                         sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_anon_server_credentials_t](#) structure.

gnutls_anon_allocate_server_credentials ()

```
int gnutls_anon_allocate_server_credentials (gnutls_anon_server_credentials_t * ←
                                             sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc : is a pointer to a [gnutls_anon_server_credentials_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_anon_set_server_dh_params ()

```
void gnutls_anon_set_server_dh_params (gnutls_anon_server_credentials_t *res,
                                     gnutls_dh_params_t dh_params);
```

This function will set the Diffie-Hellman parameters for an anonymous server to use. These parameters will be used in Anonymous Diffie-Hellman cipher suites.

res : is a `gnutls_anon_server_credentials_t` structure

dh_params : is a structure that holds Diffie-Hellman parameters.

gnutls_anon_set_server_params_function ()

```
void gnutls_anon_set_server_params_function (gnutls_anon_server_credentials_t *res,
                                             gnutls_params_function *func);
```

This function will set a callback in order for the server to get the Diffie-Hellman parameters for anonymous authentication. The callback should return zero on success.

res : is a `gnutls_certificate_credentials_t` structure

func : is the function to be called

gnutls_anon_free_client_credentials ()

```
void gnutls_anon_free_client_credentials (gnutls_anon_client_credentials_t *sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a `gnutls_anon_client_credentials_t` structure.

gnutls_anon_allocate_client_credentials ()

```
int gnutls_anon_allocate_client_credentials (gnutls_anon_client_credentials_t *sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc : is a pointer to a `gnutls_anon_client_credentials_t` structure.

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_certificate_free_credentials ()

```
void gnutls_certificate_free_credentials (gnutls_certificate_credentials_t *sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

This function does not free any temporary parameters associated with this structure (ie RSA and DH parameters are not freed by this function).

sc : is a `gnutls_certificate_credentials_t` structure.

gnutls_certificate_allocate_credentials ()

```
int gnutls_certificate_allocate_credentials
(gnutls_certificate_credentials_t * ←
 res);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

res : is a pointer to a [gnutls_certificate_credentials_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_certificate_free_keys ()

```
void gnutls_certificate_free_keys
(sc);
```

This function will delete all the keys and the certificates associated with the given credentials. This function must not be called when a TLS negotiation that uses the credentials is in progress.

sc : is a [gnutls_certificate_credentials_t](#) structure.

gnutls_certificate_free_cas ()

```
void gnutls_certificate_free_cas
(sc);
```

This function will delete all the CAs associated with the given credentials. Servers that do not use [gnutls_certificate_verify_peers2\(\)](#) may call this to save some memory.

sc : is a [gnutls_certificate_credentials_t](#) structure.

gnutls_certificate_free_ca_names ()

```
void gnutls_certificate_free_ca_names
(sc);
```

This function will delete all the CA name in the given credentials. Clients may call this to save some memory since in client side the CA names are not used. Servers might want to use this function if a large list of trusted CAs is present and sending the names of it would just consume bandwidth without providing information to client.

CA names are used by servers to advertize the CAs they support to clients.

sc : is a [gnutls_certificate_credentials_t](#) structure.

gnutls_certificate_free_crls ()

```
void gnutls_certificate_free_crls
(sc);
```

This function will delete all the CRLs associated with the given credentials.

sc : is a [gnutls_certificate_credentials_t](#) structure.

gnutls_certificate_set_dh_params ()

```
void gnutls_certificate_set_dh_params (gnutls_certificate_credentials_t *res,
                                     gnutls_dh_params_t dh_params);
```

This function will set the Diffie-Hellman parameters for a certificate server to use. These parameters will be used in Ephemeral Diffie-Hellman cipher suites. Note that only a pointer to the parameters are stored in the certificate handle, so if you deallocate the parameters before the certificate is deallocated, you must change the parameters stored in the certificate first.

res : is a `gnutls_certificate_credentials_t` structure

dh_params : is a structure that holds Diffie-Hellman parameters.

gnutls_certificate_set_rsa_export_params ()

```
void gnutls_certificate_set_rsa_export_params (gnutls_certificate_credentials_t *res,
                                              gnutls_rsa_params_t rsa_params);
```

This function will set the temporary RSA parameters for a certificate server to use. These parameters will be used in RSA-EXPORT cipher suites.

res : is a `gnutls_certificate_credentials_t` structure

rsa_params : is a structure that holds temporary RSA parameters.

gnutls_certificate_set_verify_flags ()

```
void gnutls_certificate_set_verify_flags (gnutls_certificate_credentials_t *res,
                                         unsigned int flags);
```

This function will set the flags to be used at verification of the certificates. Flags must be OR of the [gnutls_certificate_verify_flags](#) enumerations.

res : is a `gnutls_certificate_credentials_t` structure

flags : are the flags

gnutls_certificate_set_verify_limits ()

```
void gnutls_certificate_set_verify_limits (gnutls_certificate_credentials_t *res,
                                         unsigned int max_bits,
                                         unsigned int max_depth);
```

This function will set some upper limits for the default verification function, [gnutls_certificate_verify_peers2\(\)](#), to avoid denial of service attacks. You can set them to zero to disable limits.

res : is a `gnutls_certificate_credentials` structure

max_bits : is the number of bits of an acceptable certificate (default 8200)

max_depth : is maximum depth of the verification of a certificate chain (default 5)

gnutls_certificate_set_x509_trust_file ()

```
int gnutls_certificate_set_x509_trust_file
    (gnutls_certificate_credentials_t *res,
     const char *cafile,
     gnutls_x509_crt_fmt_t type);
```

This function adds the trusted CAs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using [gnutls_certificate_verify_peers2\(\)](#). This function may be called multiple times.

In case of a server the names of the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using [gnutls_certificate_send_x509_rdn_sequence\(\)](#).

This function can also accept PKCS 11 URLs. In that case it will import all certificates that are marked as trusted.

res : is a [gnutls_certificate_credentials_t](#) structure.

cafile : is a file containing the list of trusted CAs (DER or PEM list)

type : is PEM or DER

Returns : number of certificates processed, or a negative value on error.

gnutls_certificate_set_x509_trust_mem ()

```
int gnutls_certificate_set_x509_trust_mem
    (gnutls_certificate_credentials_t *res,
     const gnutls_datum_t *ca,
     gnutls_x509_crt_fmt_t type);
```

This function adds the trusted CAs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using [gnutls_certificate_verify_peers2\(\)](#). This function may be called multiple times.

In case of a server the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using [gnutls_certificate_send_x509_rdn_sequence\(\)](#).

res : is a [gnutls_certificate_credentials_t](#) structure.

ca : is a list of trusted CAs or a DER certificate

type : is DER or PEM

Returns : the number of certificates processed or a negative value on error.

gnutls_certificate_set_x509_crl_file ()

```
int gnutls_certificate_set_x509_crl_file
    (gnutls_certificate_credentials_t *res,
     const char *crlfile,
     gnutls_x509_crt_fmt_t type);
```

This function adds the trusted CRLs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using [gnutls_certificate_verify_peers2\(\)](#). This function may be called multiple times.

res : is a [gnutls_certificate_credentials_t](#) structure.

crlfile : is a file containing the list of verified CRLs (DER or PEM list)

type : is PEM or DER

Returns : number of CRLs processed or a negative value on error.

gnutls_certificate_set_x509_crl_mem ()

```
int gnutls_certificate_set_x509_crl_mem (gnutls_certificate_credentials_t *res,
                                         const gnutls_datum_t *CRL,
                                         gnutls_x509_crt_fmt_t type);
```

This function adds the trusted CRLs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using [gnutls_certificate_verify_peers2\(\)](#). This function may be called multiple times.

res : is a [gnutls_certificate_credentials_t](#) structure.

CRL : is a list of trusted CRLs. They should have been verified before.

type : is DER or PEM

Returns : number of CRLs processed, or a negative value on error.

gnutls_certificate_set_x509_key_file ()

```
int gnutls_certificate_set_x509_key_file (gnutls_certificate_credentials_t *res,
                                         const char *certfile,
                                         const char *keyfile,
                                         gnutls_x509_crt_fmt_t type);
```

This function sets a certificate/private key pair in the [gnutls_certificate_credentials_t](#) structure. This function may be called more than once (in case multiple keys/certificates exist for the server). For clients that wants to send more than its own end entity certificate (e.g., also an intermediate CA cert) then put the certificate chain in *certfile*.

Currently only PKCS-1 encoded RSA and DSA private keys are accepted by this function.

This function can also accept PKCS 11 URLs. In that case it will import the private key and certificate indicated by the urls.

res : is a [gnutls_certificate_credentials_t](#) structure.

certfile : is a file that containing the certificate list (path) for the specified private key, in PKCS7 format, or a list of certificates

keyfile : is a file that contains the private key

type : is PEM or DER

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_certificate_set_x509_key_mem ()

```
int gnutls_certificate_set_x509_key_mem (gnutls_certificate_credentials_t *res,
                                         const gnutls_datum_t *cert,
                                         const gnutls_datum_t *key,
                                         gnutls_x509_crt_fmt_t type);
```

This function sets a certificate/private key pair in the [gnutls_certificate_credentials_t](#) structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

Currently are supported: RSA PKCS-1 encoded private keys, DSA private keys.

DSA private keys are encoded the OpenSSL way, which is an ASN.1 DER sequence of 6 INTEGERS - version, p, q, g, pub, priv.

Note that the keyUsage (2.5.29.15) PKIX extension in X.509 certificates is supported. This means that certificates intended for signing cannot be used for ciphersuites that require encryption.

If the certificate and the private key are given in PEM encoding then the strings that hold their values must be null terminated.

The *key* may be **NULL** if you are using a sign callback, see [gnutls_sign_callback_set\(\)](#).

res : is a [gnutls_certificate_credentials_t](#) structure.

cert : contains a certificate list (path) for the specified private key

key : is the private key, or **NULL**

type : is PEM or DER

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_certificate_send_x509_rdn_sequence ()

```
void gnutls_certificate_send_x509_rdn_sequence
(gnutls_session_t session,
 int status);
```

If status is non zero, this function will order gnutls not to send the rdnSequence in the certificate request message. That is the server will not advertize it's trusted CAs to the peer. If status is zero then the default behaviour will take effect, which is to advertize the server's trusted CAs.

This function has no effect in clients, and in authentication methods other than certificate with X.509 certificates.

session : is a pointer to a [gnutls_session_t](#) structure.

status : is 0 or 1

gnutls_certificate_set_x509_simple_pkcs12_file ()

```
int gnutls_certificate_set_x509_simple_pkcs12_file
(gnutls_certificate_credentials_t *res,
 const char *pkcs12file,
 gnutls_x509_crt_fmt_t type,
 const char *password);
```

This function sets a certificate/private key pair and/or a CRL in the [gnutls_certificate_credentials_t](#) structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

MAC:ed PKCS¹² files are supported. Encrypted PKCS¹² bags are supported. Encrypted PKCS#8 private keys are supported. However, only password based security, and the same password for all operations, are supported.

The private keys may be RSA PKCS#1 or DSA private keys encoded in the OpenSSL way.

PKCS¹² file may contain many keys and/or certificates, and there is no way to identify which key/certificate pair you want. You should make sure the PKCS¹² file only contain one key/certificate pair and/or one CRL.

It is believed that the limitations of this function is acceptable for most usage, and that any more flexibility would introduce complexity that would make it harder to use this functionality at all.

res : is a [gnutls_certificate_credentials_t](#) structure.

pkcs12file : filename of file containing PKCS¹² blob.

type : PEM or DER of the *pkcs12file*.

password : optional password used to decrypt PKCS¹² file, bags and keys.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_certificate_set_x509_simple_pkcs12_mem ()

```
int gnutls_certificate_set_x509_simple_pkcs12_mem
(gnutls_certificate_credentials_t *res,
 const gnutls_datum_t *p12blob,
 gnutls_x509_crt_fmt_t type,
 const char *password);
```

This function sets a certificate/private key pair and/or a CRL in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

MAC:ed PKCS12 files are supported. Encrypted PKCS12 bags are supported. Encrypted PKCS#8 private keys are supported. However, only password based security, and the same password for all operations, are supported.

The private keys may be RSA PKCS#1 or DSA private keys encoded in the OpenSSL way.

PKCS12 file may contain many keys and/or certificates, and there is no way to identify which key/certificate pair you want. You should make sure the PKCS12 file only contain one key/certificate pair and/or one CRL.

It is believed that the limitations of this function is acceptable for most usage, and that any more flexibility would introduce complexity that would make it harder to use this functionality at all.

res : is a `gnutls_certificate_credentials_t` structure.

p12blob : the PKCS12 blob.

type : is PEM or DER of the *pkcs12file*.

password : optional password used to decrypt PKCS12 file, bags and keys.

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

Since 2.8.0

gnutls_x509_privkey_t

```
typedef struct gnutls_x509_privkey_int *gnutls_x509_privkey_t;
```

struct gnutls_x509_crl_int

```
struct gnutls_x509_crl_int;
```

gnutls_x509_crl_t

```
typedef struct gnutls_x509_crl_int *gnutls_x509_crl_t;
```

struct gnutls_x509_crt_int

```
struct gnutls_x509_crt_int;
```

gnutls_x509_crt_t

```
typedef struct gnutls_x509_crt_int *gnutls_x509_crt_t;
```

struct gnutls_openpgp_keyring_int

```
struct gnutls_openpgp_keyring_int;
```

gnutls_openpgp_keyring_t

```
typedef struct gnutls_openpgp_keyring_int *gnutls_openpgp_keyring_t;
```

gnutls_certificate_set_x509_key ()

```
int gnutls_certificate_set_x509_key (gnutls_certificate_credentials_t *res,
                                     gnutls_x509_crt_t *cert_list,
                                     int cert_list_size,
                                     gnutls_x509_privkey_t key);
```

This function sets a certificate/private key pair in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server). For clients that wants to send more than its own end entity certificate (e.g., also an intermediate CA cert) then put the certificate chain in `cert_list`.

res : is a `gnutls_certificate_credentials_t` structure.

cert_list : contains a certificate list (path) for the specified private key

cert_list_size : holds the size of the certificate list

key : is a `gnutls_x509_privkey_t` key

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

Since 2.4.0

gnutls_certificate_set_x509_trust ()

```
int gnutls_certificate_set_x509_trust (gnutls_certificate_credentials_t *res,
                                       gnutls_x509_crt_t *ca_list,
                                       int ca_list_size);
```

This function adds the trusted CAs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using `gnutls_certificate_verify_peers2()`. This function may be called multiple times.

In case of a server the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using `gnutls_certificate_send_x509_rdn_sequence()`.

res : is a `gnutls_certificate_credentials_t` structure.

ca_list : is a list of trusted CAs

ca_list_size : holds the size of the CA list

Returns : `GNUTLS_E_SUCCESS` on success, or an error code.

Since 2.4.0

gnutls_certificate_set_x509_crl ()

```
int gnutls_certificate_set_x509_crl (gnutls_certificate_credentials_t *res,
                                     gnutls_x509_crl_t **crl_list,
                                     int crl_list_size);
```

This function adds the trusted CRLs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using [gnutls_certificate_verify_peers2\(\)](#). This function may be called multiple times.

res : is a [gnutls_certificate_credentials_t](#) structure.

crl_list : is a list of trusted CRLs. They should have been verified before.

crl_list_size : holds the size of the crl_list

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

Since 2.4.0

gnutls_certificate_get_x509_cas ()

```
void gnutls_certificate_get_x509_cas (gnutls_certificate_credentials_t *sc,
                                       gnutls_x509_crt_t ***x509_ca_list,
                                       unsigned int *ncas);
```

This function will export all the CAs associated with the given credentials.

sc : is a [gnutls_certificate_credentials_t](#) structure.

x509_ca_list : will point to the CA list. Should be treated as constant

ncas : the number of CAs

Since 2.4.0

gnutls_certificate_get_x509_crls ()

```
void gnutls_certificate_get_x509_crls (gnutls_certificate_credentials_t *sc,
                                         gnutls_x509_crl_t ***x509_crl_list,
                                         unsigned int *ncrls);
```

This function will export all the CRLs associated with the given credentials.

sc : is a [gnutls_certificate_credentials_t](#) structure.

x509_crl_list : the exported CRL list. Should be treated as constant

ncrls : the number of exported CRLs

Since 2.4.0

gnutls_certificate_get_openpgp_keyring ()

```
void gnutls_certificate_get_openpgp_keyring
(gnutls_certificate_credentials_t *sc,
gnutls_openpgp_keyring_t *keyring) ;
```

This function will export the OpenPGP keyring associated with the given credentials.

sc : is a [gnutls_certificate_credentials_t](#) structure.

keyring : the exported keyring. Should be treated as constant

Since 2.4.0

gnutls_global_init ()

```
int gnutls_global_init (void);
```

This function initializes the global data to defaults. Every gnutls application has a global data which holds common parameters shared by gnutls session structures. You should call [gnutls_global_deinit\(\)](#) when gnutls usage is no longer needed

Note that this function will also initialize the underlying crypto backend, if it has not been initialized before.

This function increment a global counter, so that [gnutls_global_deinit\(\)](#) only releases resources when it has been called as many times as [gnutls_global_init\(\)](#). This is useful when GnuTLS is used by more than one library in an application. This function can be called many times, but will only do something the first time.

Note! This function is not thread safe. If two threads call this function simultaneously, they can cause a race between checking the global counter and incrementing it, causing both threads to execute the library initialization code. That would lead to a memory leak. To handle this, your application could invoke this function after aquiring a thread mutex. To ignore the potential memory leak is also an option.

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_global_deinit ()

```
void gnutls_global_deinit (void);
```

This function deinitializes the global data, that were initialized using [gnutls_global_init\(\)](#).

Note! This function is not thread safe. See the discussion for [gnutls_global_init\(\)](#) for more information.

mutex_init_func ()

```
int (*mutex_init_func) (void **mutex);
```

mutex :

Returns :

mutex_lock_func ()

```
int (*mutex_lock_func) (void **mutex);
```

mutex :

Returns :

mutex_unlock_func ()

```
int          (*mutex_unlock_func)           (void **mutex);
```

mutex :

Returns :

mutex_deinit_func ()

```
int          (*mutex_deinit_func)           (void **mutex);
```

mutex :

Returns :

gnutls_global_set_mutex ()

```
void         gnutls_global_set_mutex        (mutex_init_func init,
                                              mutex_deinit_func Param2,
                                              mutex_lock_func Param3,
                                              mutex_unlock_func Param4);
```

With this function you are allowed to override the default mutex locks used in some parts of gnutls and dependent libraries. This function should be used if you have complete control of your program and libraries. Do not call this function from a library. Instead only initialize gnutls and the default OS mutex locks will be used.

This function must be called before [gnutls_global_init\(\)](#).

init : mutex initialization function

Param2 :

Param3 :

Param4 :

gnutls_alloc_function ()

```
void *       (*gnutls_alloc_function)        (size_t Param1);
```

Param1 :

Returns :

gnutls_calloc_function ()

```
void *       (*gnutls_calloc_function)        (size_t Param1,
                                                size_t Param2);
```

Param1 :

Param2 :

Returns :

gnutls_is_secure_function ()

```
int (*gnutls_is_secure_function) (const void *Param1);
```

Param1 :

Returns :

gnutls_free_function ()

```
void (*gnutls_free_function) (void *Param1);
```

Param1 :

gnutls_realloc_function ()

```
void * (*gnutls_realloc_function) (void *Param1,
                                  size_t Param2);
```

Param1 :

Param2 :

Returns :

gnutls_global_set_mem_functions ()

```
void gnutls_global_set_mem_functions (gnutls_alloc_function alloc_func,
                                     gnutls_alloc_function secure_alloc_func,
                                     gnutls_is_secure_function is_secure_func,
                                     gnutls_realloc_function realloc_func,
                                     gnutls_free_function free_func);
```

This is the function where you set the memory allocation functions gnutls is going to use. By default the libc's allocation functions ([malloc\(\)](#), [free\(\)](#)), are used by gnutls, to allocate both sensitive and non-sensitive data. This function is provided to set the memory allocation functions to something other than the defaults.

This function must be called before [gnutls_global_init\(\)](#) is called. This function is not thread safe.

alloc_func : it's the default memory allocation function. Like [malloc\(\)](#).

secure_alloc_func : This is the memory allocation function that will be used for sensitive data.

is_secure_func : a function that returns 0 if the memory given is not secure. May be NULL.

realloc_func : A realloc function

free_func : The function that frees allocated data. Must accept a NULL pointer.

gnutls_malloc

```
extern gnutls_alloc_function gnutls_malloc;
```

This function will allocate 's' bytes data, and return a pointer to memory. This function is supposed to be used by callbacks.
The allocation function used is the one set by [gnutls_global_set_mem_functions\(\)](#).

gnutls_secure_malloc

```
extern gnutls_alloc_function gnutls_secure_malloc;
```

gnutls_realloc

```
extern gnutls_realloc_function gnutls_realloc;
```

gnutls_calloc

```
extern gnutls_calloc_function gnutls_calloc;
```

gnutls_free

```
extern gnutls_free_function gnutls_free;
```

This function will free data pointed by ptr.

The deallocation function used is the one set by [gnutls_global_set_mem_functions\(\)](#).

gnutls_strdup ()

```
char * (*gnutls_strdup) (const char *Param1);
```

Param1 :

Returns :

gnutls_log_func ()

```
void (*gnutls_log_func) (..., const char *Param2);
```

... :

Param2 :

gnutls_global_set_log_function ()

```
void gnutls_global_set_log_function (gnutls_log_func log_func);
```

This is the function where you set the logging function gnutls is going to use. This function only accepts a character array. Normally you may not use this function since it is only used for debugging purposes.

gnutls_log_func is of the form, void (*gnutls_log_func)(int level, const char*);

log_func : it's a log function

gnutls_global_set_log_level ()

```
void gnutls_global_set_log_level (int level);
```

This is the function that allows you to set the log level. The level is an integer between 0 and 9. Higher values mean more verbosity. The default value is 0. Larger values should only be used with care, since they may reveal sensitive information.

Use a log level over 10 to enable all debugging options.

level : it's an integer from 0 to 9.

gnutls_dh_params_init ()

```
int gnutls_dh_params_init (gnutls_dh_params_t *dh_params);
```

This function will initialize the DH parameters structure.

dh_params : Is a structure that will hold the prime numbers

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_deinit ()

```
void gnutls_dh_params_deinit (gnutls_dh_params_t dh_params);
```

This function will deinitialize the DH parameters structure.

dh_params : Is a structure that holds the prime numbers

gnutls_dh_params_import_raw ()

```
int gnutls_dh_params_import_raw (gnutls_dh_params_t dh_params,
                                const gnutls_datum_t *prime,
                                const gnutls_datum_t *generator);
```

This function will replace the pair of prime and generator for use in the Diffie-Hellman key exchange. The new parameters should be stored in the appropriate gnutls_datum.

dh_params : Is a structure that will hold the prime numbers

prime : holds the new prime

generator : holds the new generator

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_import_pkcs3 ()

```
int gnutls_dh_params_import_pkcs3 (gnutls_dh_params_t params,
                                const gnutls_datum_t *pkcs3_params ←
                                ,
                                gnutls_x509_crt_fmt_t format);
```

This function will extract the DHParams found in a PKCS3 formatted structure. This is the format generated by "openssl dhparam" tool.

If the structure is PEM encoded, it should have a header of "BEGIN DH PARAMETERS".

params : A structure where the parameters will be copied to

pkcs3_params : should contain a PKCS3 DHParams structure PEM or DER encoded

format : the format of params. PEM or DER.

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_generate2 ()

```
int gnutls_dh_params_generate2 (gnutls_dh_params_t params,
                             unsigned int bits);
```

This function will generate a new pair of prime and generator for use in the Diffie-Hellman key exchange. The new parameters will be allocated using **gnutls_malloc()** and will be stored in the appropriate datum. This function is normally slow.

Do not set the number of bits directly, use **gnutls_sec_param_to_pk_bits()** to get bits for **GNUTLS_PK_DSA**. Also note that the DH parameters are only useful to servers. Since clients use the parameters sent by the server, it's of no use to call this in client side.

params : Is the structure that the DH parameters will be stored

bits : is the prime's number of bits

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_export_pkcs3 ()

```
int gnutls_dh_params_export_pkcs3 (gnutls_dh_params_t params,
                                 gnutls_x509_crt_fmt_t format,
                                 unsigned char *params_data,
                                 size_t *params_data_size);
```

This function will export the given dh parameters to a PKCS3 DHParams structure. This is the format generated by "openssl dhparam" tool. If the buffer provided is not long enough to hold the output, then **GNUTLS_E_SHORT_MEMORY_BUFFER** will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN DH PARAMETERS".

params : Holds the DH parameters

format : the format of output params. One of PEM or DER.

params_data : will contain a PKCS3 DHParams structure PEM or DER encoded

params_data_size : holds the size of params_data (and will be replaced by the actual size of parameters)

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_export_raw ()

int	gnutls_dh_params_export_raw	(gnutls_dh_params_t params, gnutls_datum_t *prime, gnutls_datum_t *generator, unsigned int *bits);
-----	-----------------------------	---

This function will export the pair of prime and generator for use in the Diffie-Hellman key exchange. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

params : Holds the DH parameters

prime : will hold the new prime

generator : will hold the new generator

bits : if non null will hold is the prime's number of bits

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_cpy ()

int	gnutls_dh_params_cpy	(gnutls_dh_params_t dst, gnutls_dh_params_t src);
-----	----------------------	--

This function will copy the DH parameters structure from source to destination.

dst : Is the destination structure, which should be initialized.

src : Is the source structure

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_rsa_params_init ()

int	gnutls_rsa_params_init	(gnutls_rsa_params_t *rsa_params);
-----	------------------------	------------------------------------

This function will initialize the temporary RSA parameters structure.

rsa_params : Is a structure that will hold the parameters

Returns : [GNUTLS_E_SUCCESS](#) on success, or an negative error code.

gnutls_rsa_params_deinit ()

void	gnutls_rsa_params_deinit	(gnutls_rsa_params_t rsa_params);
------	--------------------------	-----------------------------------

This function will deinitialize the RSA parameters structure.

rsa_params : Is a structure that holds the parameters

gnutls_rsa_params_cpy ()

int	gnutls_rsa_params_cpy	(gnutls_rsa_params_t dst, gnutls_rsa_params_t src);
-----	-----------------------	--

This function will copy the RSA parameters structure from source to destination.

dst : Is the destination structure, which should be initialized.

src : Is the source structure

Returns : **GNUTLS_E_SUCCESS** on success, or an negative error code.

gnutls_rsa_params_import_raw ()

int	gnutls_rsa_params_import_raw	(gnutls_rsa_params_t rsa_params, const gnutls_datum_t *m, const gnutls_datum_t *e, const gnutls_datum_t *d, const gnutls_datum_t *p, const gnutls_datum_t *q, const gnutls_datum_t *u);
-----	------------------------------	---

This function will replace the parameters in the given structure. The new parameters should be stored in the appropriate gnutls_datum.

rsa_params : Is a structure will hold the parameters

m : holds the modulus

e : holds the public exponent

d : holds the private exponent

p : holds the first prime (p)

q : holds the second prime (q)

u : holds the coefficient

Returns : **GNUTLS_E_SUCCESS** on success, or an negative error code.

gnutls_rsa_params_generate2 ()

int	gnutls_rsa_params_generate2	(gnutls_rsa_params_t params, unsigned int bits);
-----	-----------------------------	---

This function will generate new temporary RSA parameters for use in RSA-EXPORT ciphersuites. This function is normally slow.

Note that if the parameters are to be used in export cipher suites the bits value should be 512 or less. Also note that the generation of new RSA parameters is only useful to servers. Clients use the parameters sent by the server, thus it's no use calling this in client side.

params : The structure where the parameters will be stored

bits : is the prime's number of bits

Returns : **GNUTLS_E_SUCCESS** on success, or an negative error code.

gnutls_rsa_params_export_raw ()

```
int gnutls_rsa_params_export_raw (gnutls_rsa_params_t params,
                                 gnutls_datum_t *m,
                                 gnutls_datum_t *e,
                                 gnutls_datum_t *d,
                                 gnutls_datum_t *p,
                                 gnutls_datum_t *q,
                                 gnutls_datum_t *u,
                                 unsigned int *bits);
```

This function will export the RSA parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

params : a structure that holds the rsa parameters

m : will hold the modulus

e : will hold the public exponent

d : will hold the private exponent

p : will hold the first prime (p)

q : will hold the second prime (q)

u : will hold the coefficient

bits : if non null will hold the prime's number of bits

Returns : [GNUTLS_E_SUCCESS](#) on success, or an negative error code.

gnutls_rsa_params_export_pkcs1 ()

```
int gnutls_rsa_params_export_pkcs1 (gnutls_rsa_params_t params,
                                    gnutls_x509_crt_fmt_t format,
                                    unsigned char *params_data,
                                    size_t *params_data_size);
```

This function will export the given RSA parameters to a PKCS1 RSAPublicKey structure. If the buffer provided is not long enough to hold the output, then [GNUTLS_E_SHORT_MEMORY_BUFFER](#) will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN RSA PRIVATE KEY".

params : Holds the RSA parameters

format : the format of output params. One of PEM or DER.

params_data : will contain a PKCS1 RSAPublicKey structure PEM or DER encoded

params_data_size : holds the size of params_data (and will be replaced by the actual size of parameters)

Returns : [GNUTLS_E_SUCCESS](#) on success, or an negative error code.

gnutls_rsa_params_import_pkcs1 ()

```
int gnutls_rsa_params_import_pkcs1 (gnutls_rsa_params_t params,
                                   const gnutls_datum_t *pkcs1_params ←
                                   ,
                                   gnutls_x509_crt_fmt_t format);
```

This function will extract the RSA PublicKey found in a PKCS1 formatted structure.

If the structure is PEM encoded, it should have a header of "BEGIN RSA PRIVATE KEY".

params : A structure where the parameters will be copied to

pkcs1_params : should contain a PKCS1 RSA PublicKey structure PEM or DER encoded

format : the format of params. PEM or DER.

Returns : **GNUTLS_E_SUCCESS** on success, or an negative error code.

gnutls_pull_func ()

```
ssize_t (*gnutls_pull_func) (gnutls_transport_ptr_t Param1,
                           void *Param2,
                           size_t Param3);
```

Param1 :

Param2 :

Param3 :

Returns :

gnutls_push_func ()

```
ssize_t (*gnutls_push_func) (gnutls_transport_ptr_t Param1,
                           const void *Param2,
                           size_t Param3);
```

Param1 :

Param2 :

Param3 :

Returns :

gnutls_vec_push_func ()

```
ssize_t (*gnutls_vec_push_func) (gnutls_transport_ptr_t Param1,
                               const giovec_t *iov,
                               int iovcnt);
```

Param1 :

iov :

iovcnt :

Returns :

gnutls_errno_func ()

int	(*gnutls_errno_func)	(gnutls_transport_ptr_t Param1);
-----	----------------------	----------------------------------

Param1 :**Returns :****gnutls_transport_set_ptr ()**

void	gnutls_transport_set_ptr	(gnutls_session_t session, gnutls_transport_ptr_t ptr);
------	--------------------------	--

Used to set the first argument of the transport function (like PUSH and PULL). In berkeley style sockets this function will set the connection handle.

session : is a [gnutls_session_t](#) structure.**ptr :** is the value.**gnutls_transport_set_ptr2 ()**

void	gnutls_transport_set_ptr2	(gnutls_session_t session, gnutls_transport_ptr_t recv_ptr, gnutls_transport_ptr_t send_ptr);
------	---------------------------	---

Used to set the first argument of the transport function (like PUSH and PULL). In berkeley style sockets this function will set the connection handle. With this function you can use two different pointers for receiving and sending.

session : is a [gnutls_session_t](#) structure.**recv_ptr :** is the value for the pull function**send_ptr :** is the value for the push function**gnutls_transport_get_ptr ()**

gnutls_transport_ptr_t	gnutls_transport_get_ptr	(gnutls_session_t session);
------------------------	--------------------------	-----------------------------

Used to get the first argument of the transport function (like PUSH and PULL). This must have been set using [gnutls_transport_set_ptr\(\)](#).

session : is a [gnutls_session_t](#) structure.**Returns :** first argument of the transport function.**gnutls_transport_get_ptr2 ()**

void	gnutls_transport_get_ptr2	(gnutls_session_t session, gnutls_transport_ptr_t *recv_ptr, gnutls_transport_ptr_t *send_ptr);
------	---------------------------	---

Used to get the arguments of the transport functions (like PUSH and PULL). These should have been set using [gnutls_transport_set_ptr2\(\)](#).

session : is a [gnutls_session_t](#) structure.**recv_ptr :** will hold the value for the pull function**send_ptr :** will hold the value for the push function

gnutls_transport_set_lowat ()

```
void gnutls_transport_set_lowat (gnutls_session_t session,
                               int num);
```

Used to set the lowat value in order for select to check if there are pending data to socket buffer. Used only if you have changed the default low water value (default is 1). Normally you will not need that function. This function is only useful if using berkeley style sockets. Otherwise it must be called and set lowat to zero.

session : is a [gnutls_session_t](#) structure.

num : is the low water value.

gnutls_transport_set_push_function2 ()

```
void gnutls_transport_set_push_function2 (gnutls_session_t session,
                                         gnutls_vec_push_func vec_func);
```

This is the function where you set a push function for gnutls to use in order to send data. If you are going to use berkeley style sockets, you do not need to use this function since the default (send(2)) will probably be ok. Otherwise you should specify this function for gnutls to be able to send data.

PUSH_FUNC is of the form, ssize_t (*gnutls_push_func)(gnutls_transport_ptr_t, const void*, size_t);

session : is a [gnutls_session_t](#) structure.

vec_func : a callback function similar to [writev\(\)](#)

gnutls_transport_set_push_function ()

```
void gnutls_transport_set_push_function (gnutls_session_t session,
                                         gnutls_push_func push_func);
```

This is the function where you set a push function for gnutls to use in order to send data. If you are going to use berkeley style sockets, you do not need to use this function since the default (send(2)) will probably be ok. Otherwise you should specify this function for gnutls to be able to send data.

PUSH_FUNC is of the form, ssize_t (*gnutls_push_func)(gnutls_transport_ptr_t, const void*, size_t);

session : is a [gnutls_session_t](#) structure.

push_func : a callback function similar to [write\(\)](#)

gnutls_transport_set_pull_function ()

```
void gnutls_transport_set_pull_function (gnutls_session_t session,
                                         gnutls_pull_func pull_func);
```

This is the function where you set a function for gnutls to receive data. Normally, if you use berkeley style sockets, do not need to use this function since the default (recv(2)) will probably be ok.

PULL_FUNC is of the form, ssize_t (*gnutls_pull_func)(gnutls_transport_ptr_t, void*, size_t);

session : is a [gnutls_session_t](#) structure.

pull_func : a callback function similar to [read\(\)](#)

gnutls_transport_set_errno_function ()

```
void gnutls_transport_set_errno_function (gnutls_session_t session,
                                         gnutls_errno_func errno_func);
```

This is the function where you set a function to retrieve errno after a failed push or pull operation.

`errno_func` is of the form, `int (*gnutls_errno_func)(gnutls_transport_ptr_t);` and should return the `errno`.

`session` : is a `gnutls_session_t` structure.

`errno_func` : a callback function similar to `write()`

gnutls_transport_set_errno ()

```
void gnutls_transport_set_errno (gnutls_session_t session,
                                int err);
```

Store `err` in the session-specific `errno` variable. Useful values for `err` is `EAGAIN` and `EINTR`, other values are treated will be treated as real errors in the push/pull function.

This function is useful in replacement push/pull functions set by `gnutls_transport_set_push_function` and `gnutls_transport_set_pulldown` under Windows, where the replacement push/pull may not have access to the same `errno` variable that is used by GnuTLS (e.g., the application is linked to `msvcr71.dll` and gnutls is linked to `msvcr7.dll`).

If you don't have the `session` variable easily accessible from the push/pull function, and don't worry about thread conflicts, you can also use `gnutls_transport_set_global_errno()`.

`session` : is a `gnutls_session_t` structure.

`err` : error value to store in session-specific `errno` variable.

gnutls_transport_set_global_errno ()

```
void gnutls_transport_set_global_errno (int err);
```

Store `err` in the global `errno` variable. Useful values for `err` is `EAGAIN` and `EINTR`, other values are treated will be treated as real errors in the push/pull function.

This function is useful in replacement push/pull functions set by `gnutls_transport_set_push_function` and `gnutls_transport_set_pulldown` under Windows, where the replacement push/pull may not have access to the same `errno` variable that is used by GnuTLS (e.g., the application is linked to `msvcr71.dll` and gnutls is linked to `msvcr7.dll`).

Whether this function is thread safe or not depends on whether the global variable `errno` is thread safe, some system libraries make it a thread-local variable. When feasible, using the guaranteed thread-safe `gnutls_transport_set_errno()` may be better.

`err` : error value to store in global `errno` variable.

gnutls_session_set_ptr ()

```
void gnutls_session_set_ptr (gnutls_session_t session,
                            void *ptr);
```

This function will set (associate) the user given pointer `ptr` to the session structure. This is pointer can be accessed with `gnutls_session_get_ptr()`.

`session` : is a `gnutls_session_t` structure.

`ptr` : is the user pointer

gnutls_session_get_ptr ()

```
void * gnutls_session_get_ptr (gnutls_session_t session);
```

Get user pointer for session. Useful in callbacks. This is the pointer set with [gnutls_session_set_ptr\(\)](#).

session : is a [gnutls_session_t](#) structure.

Returns : the user given pointer from the session structure, or **NULL** if it was never set.

gnutls_openpgp_send_cert ()

```
void gnutls_openpgp_send_cert (gnutls_session_t session,
                               gnutls_openpgp_crt_status_t status);
```

This function will order gnutls to send the key fingerprint instead of the key in the initial handshake procedure. This should be used with care and only when there is indication or knowledge that the server can obtain the client's key.

session : is a pointer to a [gnutls_session_t](#) structure.

status : is one of **GNUTLS_OPENPGP_CERT**, or **GNUTLS_OPENPGP_CERT_FINGERPRINT**

gnutls_fingerprint ()

```
int gnutls_fingerprint (gnutls_digest_algorithm_t algo,
                        const gnutls_datum_t *data,
                        void *result,
                        size_t *result_size);
```

This function will calculate a fingerprint (actually a hash), of the given data. The result is not printable data. You should convert it to hex, or to something else printable.

This is the usual way to calculate a fingerprint of an X.509 DER encoded certificate. Note however that the fingerprint of an OpenPGP is not just a hash and cannot be calculated with this function.

algo : is a digest algorithm

data : is the data

result : is the place where the result will be copied (may be null).

result_size : should hold the size of the result. The actual size of the returned result will also be copied there.

Returns : On success, **GNUTLS_E_SUCCESS** (0) is returned, otherwise an error code is returned.

gnutls_srp_free_client_credentials ()

```
void gnutls_srp_free_client_credentials (gnutls_srp_client_credentials_t sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_srp_client_credentials_t](#) structure.

gnutls_srp_allocate_client_credentials ()

```
int gnutls_srp_allocate_client_credentials
      (gnutls_srp_client_credentials_t * ←
       sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc : is a pointer to a [gnutls_srp_server_credentials_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

gnutls_srp_set_client_credentials ()

```
int res,
     gnutls_srp_set_client_credentials (gnutls_srp_client_credentials_t ←
                                         const char *username,
                                         const char *password);
```

This function sets the username and password, in a [gnutls_srp_client_credentials_t](#) structure. Those will be used in SRP authentication. *username* and *password* should be ASCII strings or UTF-8 strings prepared using the "SASLprep" profile of "stringprep".

res : is a [gnutls_srp_client_credentials_t](#) structure.

username : is the user's userid

password : is the user's password

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

gnutls_srp_free_server_credentials ()

```
void gnutls_srp_free_server_credentials (gnutls_srp_server_credentials_t sc ←
                                         );
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_srp_server_credentials_t](#) structure.

gnutls_srp_allocate_server_credentials ()

```
int gnutls_srp_allocate_server_credentials
      (gnutls_srp_server_credentials_t * ←
       sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc : is a pointer to a [gnutls_srp_server_credentials_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

gnutls_srp_set_server_credentials_file ()

```
int gnutls_srp_set_server_credentials_file
      (gnutls_srp_server_credentials_t *res,
       const char *password_file,
       const char *password_conf_file);
```

This function sets the password files, in a [gnutls_srp_server_credentials_t](#) structure. Those password files hold usernames and verifiers and will be used for SRP authentication.

res : is a [gnutls_srp_server_credentials_t](#) structure.

password_file : is the SRP password file (tpasswd)

password_conf_file : is the SRP password conf file (tpasswd.conf)

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, or an error code.

gnutls_srp_server_get_username ()

```
const char * gnutls_srp_server_get_username (gnutls_session_t session);
```

This function will return the username of the peer. This should only be called in case of SRP authentication and in case of a server. Returns NULL in case of an error.

session : is a gnutls session

Returns : SRP username of the peer, or NULL in case of error.

gnutls_srp_set_prime_bits ()

```
void gnutls_srp_set_prime_bits (gnutls_session_t session,
                               unsigned int bits);
```

This function sets the minimum accepted number of bits, for use in an SRP key exchange. If zero, the default 2048 bits will be used.

In the client side it sets the minimum accepted number of bits. If a server sends a prime with less bits than that [GNUTLS_E_RECEIVED](#) will be returned by the handshake.

This function has no effect in server side.

session : is a [gnutls_session_t](#) structure.

bits : is the number of bits

Since 2.6.0

gnutls_srp_verifier ()

```
int gnutls_srp_verifier (const char *username,
                        const char *password,
                        const gnutls_datum_t *salt,
                        const gnutls_datum_t *generator,
                        const gnutls_datum_t *prime,
                        gnutls_datum_t *res);
```

This function will create an SRP verifier, as specified in RFC2945. The *prime* and *generator* should be one of the static parameters defined in gnutls/extra.h or may be generated using the libgcrypt functions `gcry_prime_generate()` and `gcry_prime_group_generate()`.

The verifier will be allocated with `malloc` and will be stored in *res* using binary format.

username: is the user's name

password: is the user's password

salt: should be some randomly generated bytes

generator: is the generator of the group

prime: is the group's prime

res: where the verifier will be stored.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, or an error code.

gnutls_srp_2048_group_prime

```
extern const gnutls_datum_t gnutls_srp_2048_group_prime;
```

gnutls_srp_2048_group_generator

```
extern const gnutls_datum_t gnutls_srp_2048_group_generator;
```

gnutls_srp_1536_group_prime

```
extern const gnutls_datum_t gnutls_srp_1536_group_prime;
```

gnutls_srp_1536_group_generator

```
extern const gnutls_datum_t gnutls_srp_1536_group_generator;
```

gnutls_srp_1024_group_prime

```
extern const gnutls_datum_t gnutls_srp_1024_group_prime;
```

gnutls_srp_1024_group_generator

```
extern const gnutls_datum_t gnutls_srp_1024_group_generator;
```

gnutls_srp_set_server_credentials_function ()

```
void gnutls_srp_set_server_credentials_function
    (gnutls_srp_server_credentials_t *cred,
     gnutls_srp_server_credentials_function *func);
```

This function can be used to set a callback to retrieve the user's SRP credentials. The callback's function form is:

```
int (*callback)(gnutls_session_t, const char* username, gnutls_datum_t* salt, gnutls_datum_t *verifier, gnutls_datum_t* g, gnutls_datum_t* n);
```

username contains the actual username. The *salt*, *verifier*, *generator* and *prime* must be filled in using the [gnutls_malloc\(\)](#). For convenience *prime* and *generator* may also be one of the static parameters defined in extra.h.

In case the callback returned a negative number then gnutls will assume that the username does not exist.

In order to prevent attackers from guessing valid usernames, if a user does not exist, g and n values should be filled in using a random user's parameters. In that case the callback must return the special value (1).

The callback function will only be called once per handshake. The callback function should return 0 on success, while -1 indicates an error.

cred : is a [gnutls_srp_server_credentials_t](#) structure.

func : is the callback function

gnutls_srp_set_client_credentials_function ()

```
void gnutls_srp_set_client_credentials_function
    (gnutls_srp_client_credentials_t *cred,
     gnutls_srp_client_credentials_function *func);
```

This function can be used to set a callback to retrieve the username and password for client SRP authentication. The callback's function form is:

```
int (*callback)(gnutls_session_t, char** username, char**password);
```

The *username* and *password* must be allocated using [gnutls_malloc\(\)](#). *username* and *password* should be ASCII strings or UTF-8 strings prepared using the "SASLprep" profile of "stringprep".

The callback function will be called once per handshake before the initial hello message is sent.

The callback should not return a negative error code the second time called, since the handshake procedure will be aborted.

The callback function should return 0 on success. -1 indicates an error.

cred : is a [gnutls_srp_server_credentials_t](#) structure.

func : is the callback function

gnutls_srp_base64_encode ()

```
int gnutls_srp_base64_encode
    (const gnutls_datum_t *data,
     char *result,
     size_t *result_size);
```

This function will convert the given data to printable data, using the base64 encoding, as used in the libsrp. This is the encoding used in SRP password files. If the provided buffer is not long enough GNUTLS_E_SHORT_MEMORY_BUFFER is returned.

Warning! This base64 encoding is not the "standard" encoding, so do not use it for non-SRP purposes.

data: contain the raw data

result: the place where base64 data will be copied

result_size: holds the size of the result

Returns : GNUTLS_E_SHORT_MEMORY_BUFFER if the buffer given is not long enough, or 0 on success.

gnutls_srp_base64_encode_alloc ()

```
int gnutls_srp_base64_encode_alloc (const gnutls_datum_t *data,  
                                  gnutls_datum_t *result);
```

This function will convert the given data to printable data, using the base64 encoding. This is the encoding used in SRP password files. This function will allocate the required memory to hold the encoded data.

You should use [gnutls_free\(\)](#) to free the returned data.

Warning! This base64 encoding is not the "standard" encoding, so do not use it for non-SRP purposes.

data: contains the raw data

result: will hold the newly allocated encoded data

Returns : 0 on success, or an error code.

gnutls_srp_base64_decode ()

```
int gnutls_srp_base64_decode (const gnutls_datum_t *b64_data,  
                            char *result,  
                            size_t *result_size);
```

This function will decode the given encoded data, using the base64 encoding found in libsrp.

Note that *b64_data* should be null terminated.

Warning! This base64 encoding is not the "standard" encoding, so do not use it for non-SRP purposes.

b64_data: contain the encoded data

result: the place where decoded data will be copied

result_size: holds the size of the result

Returns : GNUTLS_E_SHORT_MEMORY_BUFFER if the buffer given is not long enough, or 0 on success.

gnutls_srp_base64_decode_alloc ()

```
int gnutls_srp_base64_decode_alloc (const gnutls_datum_t *b64_data,  
                                  gnutls_datum_t *result);
```

This function will decode the given encoded data. The decoded data will be allocated, and stored into *result*. It will decode using the base64 algorithm as used in libsrp.

You should use [gnutls_free\(\)](#) to free the returned data.

Warning! This base64 encoding is not the "standard" encoding, so do not use it for non-SRP purposes.

b64_data: contains the encoded data

result: the place where decoded data lie

Returns: 0 on success, or an error code.

enum gnutls_psk_key_flags

```
typedef enum gnutls_psk_key_flags
{
    GNUTLS_PSK_KEY_RAW = 0,
    GNUTLS_PSK_KEY_HEX
} gnutls_psk_key_flags;
```

Enumeration of different PSK key flags.

GNUTLS_PSK_KEY_RAW PSK-key in raw format.

GNUTLS_PSK_KEY_HEX PSK-key in hex format.

gnutls_psk_free_client_credentials ()

```
void gnutls_psk_free_client_credentials (gnutls_psk_client_credentials_t sc ↪
);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc: is a [gnutls_psk_client_credentials_t](#) structure.

gnutls_psk_allocate_client_credentials ()

```
int gnutls_psk_allocate_client_credentials
(gnutls_psk_client_credentials_t * ↪
sc);
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc: is a pointer to a [gnutls_psk_server_credentials_t](#) structure.

Returns: [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_psk_set_client_credentials ()

```
int gnutls_psk_set_client_credentials (gnutls_psk_client_credentials_t * ↪
res,
                                     const char *username,
                                     const gnutls_datum_t *key,
                                     gnutls_psk_key_flags format);
```

This function sets the username and password, in a [gnutls_psk_client_credentials_t](#) structure. Those will be used in PSK authentication. *username* should be an ASCII string or UTF-8 strings prepared using the "SASLprep" profile of "stringprep". The key can be either in raw byte format or in Hex format (without the 0x prefix).

res: is a [gnutls_psk_client_credentials_t](#) structure.

username: is the user's zero-terminated userid

key: is the user's key

format: indicate the format of the key, either [GNUTLS_PSK_KEY_RAW](#) or [GNUTLS_PSK_KEY_HEX](#).

Returns: [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_psk_free_server_credentials ()

```
void gnutls_psk_free_server_credentials (gnutls_psk_server_credentials_t sc ↵
) ;
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_psk_server_credentials_t](#) structure.

gnutls_psk_allocate_server_credentials ()

```
int gnutls_psk_allocate_server_credentials (gnutls_psk_server_credentials_t * ↵
sc) ;
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

sc : is a pointer to a [gnutls_psk_server_credentials_t](#) structure.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_psk_set_server_credentials_file ()

```
int gnutls_psk_set_server_credentials_file (gnutls_psk_server_credentials_t ↵
res,
const char *password_file);
```

This function sets the password file, in a [gnutls_psk_server_credentials_t](#) structure. This password file holds usernames and keys and will be used for PSK authentication.

res : is a [gnutls_psk_server_credentials_t](#) structure.

password_file : is the PSK password file (passwd.psk)

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_psk_set_server_credentials_hint ()

```
int gnutls_psk_set_server_credentials_hint (gnutls_psk_server_credentials_t ↵
res,
const char *hint);
```

This function sets the identity hint, in a [gnutls_psk_server_credentials_t](#) structure. This hint is sent to the client to help it chose a good PSK credential (i.e., username and password).

res : is a [gnutls_psk_server_credentials_t](#) structure.

hint : is the PSK identity hint string

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

Since 2.4.0

gnutls_psk_server_get_username ()

```
const char * gnutls_psk_server_get_username (gnutls_session_t session);
```

This should only be called in case of PSK authentication and in case of a server.

session : is a gnutls session

Returns : the username of the peer, or **NULL** in case of an error.

gnutls_psk_client_get_hint ()

```
const char * gnutls_psk_client_get_hint (gnutls_session_t session);
```

The PSK identity hint may give the client help in deciding which username to use. This should only be called in case of PSK authentication and in case of a client.

session : is a gnutls session

Returns : the identity hint of the peer, or **NULL** in case of an error.

Since 2.4.0

gnutls_psk_set_server_credentials_function ()

```
void gnutls_psk_set_server_credentials_function
      (gnutls_psk_server_credentials_t ←
       cred,
       gnutls_psk_server_credentials_function ←
       *func);
```

This function can be used to set a callback to retrieve the user's PSK credentials. The callback's function form is: int (*callback)(gnutls_session_t, const char* username, gnutls_datum_t* key);

username contains the actual username. The *key* must be filled in using the [gnutls_malloc\(\)](#).

In case the callback returned a negative number then gnutls will assume that the username does not exist.

The callback function will only be called once per handshake. The callback function should return 0 on success, while -1 indicates an error.

cred : is a [gnutls_psk_server_credentials_t](#) structure.

func : is the callback function

gnutls_psk_set_client_credentials_function ()

```
void gnutls_psk_set_client_credentials_function
      (gnutls_psk_client_credentials_t ←
       cred,
       gnutls_psk_client_credentials_function ←
       *func);
```

This function can be used to set a callback to retrieve the username and password for client PSK authentication. The callback's function form is: int (*callback)(gnutls_session_t, char** username, gnutls_datum_t* key);

The *username* and *key->data* must be allocated using [gnutls_malloc\(\)](#). *username* should be ASCII strings or UTF-8 strings prepared using the "SASLprep" profile of "stringprep".

The callback function will be called once per handshake.

The callback function should return 0 on success. -1 indicates an error.

cred : is a `gnutls_psk_server_credentials_t` structure.

func : is the callback function

`gnutls_hex_encode ()`

```
int gnutls_hex_encode (const gnutls_datum_t *data,
                      char *result,
                      size_t *result_size);
```

This function will convert the given data to printable data, using the hex encoding, as used in the PSK password files.

data : contain the raw data

result : the place where hex data will be copied

result_size : holds the size of the result

Returns : `GNUTLS_E_SHORT_MEMORY_BUFFER` if the buffer given is not long enough, or 0 on success.

`gnutls_hex_decode ()`

```
int gnutls_hex_decode (const gnutls_datum_t *hex_data,
                      char *result,
                      size_t *result_size);
```

This function will decode the given encoded data, using the hex encoding used by PSK password files.

Note that hex_data should be null terminated.

hex_data : contain the encoded data

result : the place where decoded data will be copied

result_size : holds the size of the result

Returns : `GNUTLS_E_SHORT_MEMORY_BUFFER` if the buffer given is not long enough, or 0 on success.

`gnutls_psk_set_server_dh_params ()`

```
void gnutls_psk_set_server_dh_params (gnutls_psk_server_credentials_t *res,
                                      gnutls_dh_params_t dh_params);
```

This function will set the Diffie-Hellman parameters for an anonymous server to use. These parameters will be used in Diffie-Hellman exchange with PSK cipher suites.

res : is a `gnutls_psk_server_credentials_t` structure

dh_params : is a structure that holds Diffie-Hellman parameters.

gnutls_psk_set_server_params_function ()

```
void gnutls_psk_set_server_params_function
    (gnutls_psk_server_credentials_t *res,
     gnutls_params_function *func);
```

This function will set a callback in order for the server to get the Diffie-Hellman parameters for PSK authentication. The callback should return zero on success.

res : is a [gnutls_certificate_credentials_t](#) structure

func : is the function to be called

enum gnutls_x509_subject_alt_name_t

```
typedef enum gnutls_x509_subject_alt_name_t
{
    GNUTLS_SAN_DNSNAME = 1,
    GNUTLS_SAN_RFC822NAME = 2,
    GNUTLS_SAN_URI = 3,

typedef struct gnutls_pkcs11_privkey_st *gnutls_pkcs11_privkey_t;
```

enum gnutls_privkey_type_t

```
typedef enum
{
    GNUTLS_PRIVKEY_X509, /* gnutls_x509_privkey_t */
    GNUTLS_PRIVKEY_OPENPGP, /* gnutls_openpgp_privkey_t */
    GNUTLS_PRIVKEY_PKCS11/* gnutls_pkcs11_privkey_t */
} gnutls_privkey_type_t;
```

gnutls_auth_get_type ()

```
gnutls_credentials_type_t gnutls_auth_get_type (gnutls_session_t session);
```

Returns type of credentials for the current authentication schema. The returned information is to be used to distinguish the function used to access authentication data.

Eg. for CERTIFICATE ciphersuites (key exchange algorithms: [GNUTLS_KX_RSA](#), [GNUTLS_KX_DHE_RSA](#)), the same function are to be used to access the authentication data.

session : is a [gnutls_session_t](#) structure.

Returns : The type of credentials for the current authentication schema, a [gnutls_credentials_type_t](#) type.

gnutls_auth_server_get_type ()

```
gnutls_credentials_type_t gnutls_auth_server_get_type (gnutls_session_t session);
```

Returns the type of credentials that were used for server authentication. The returned information is to be used to distinguish the function used to access authentication data.

session : is a [gnutls_session_t](#) structure.

Returns : The type of credentials for the server authentication schema, a [gnutls_credentials_type_t](#) type.

gnutls_auth_client_get_type ()

```
gnutls_credentials_type_t gnutls_auth_client_get_type (gnutls_session_t session);
```

Returns the type of credentials that were used for client authentication. The returned information is to be used to distinguish the function used to access authentication data.

session : is a [gnutls_session_t](#) structure.

Returns : The type of credentials for the client authentication schema, a [gnutls_credentials_type_t](#) type.

gnutls_dh_set_prime_bits ()

```
void gnutls_dh_set_prime_bits (gnutls_session_t session,  
                             unsigned int bits);
```

This function sets the number of bits, for use in an Diffie-Hellman key exchange. This is used both in DH ephemeral and DH anonymous cipher suites. This will set the minimum size of the prime that will be used for the handshake.

In the client side it sets the minimum accepted number of bits. If a server sends a prime with less bits than that [GNUTLS_E_DH_PRIME](#) will be returned by the handshake.

This function has no effect in server side.

session : is a [gnutls_session_t](#) structure.

bits : is the number of bits

gnutls_dh_get_secret_bits ()

```
int gnutls_dh_get_secret_bits (gnutls_session_t session);
```

This function will return the bits used in the last Diffie-Hellman key exchange with the peer. Should be used for both anonymous and ephemeral Diffie-Hellman.

session : is a gnutls session

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_dh_get_peers_public_bits ()

```
int gnutls_dh_get_peers_public_bits (gnutls_session_t session);
```

Get the Diffie-Hellman public key bit size. Can be used for both anonymous and ephemeral Diffie-Hellman.

session : is a gnutls session

Returns : the public key bit size used in the last Diffie-Hellman key exchange with the peer, or a negative value in case of error.

gnutls_dh_get_prime_bits ()

```
int gnutls_dh_get_prime_bits (gnutls_session_t session);
```

This function will return the bits of the prime used in the last Diffie-Hellman key exchange with the peer. Should be used for both anonymous and ephemeral Diffie-Hellman. Note that some ciphers, like RSA and DSA without DHE, does not use a Diffie-Hellman key exchange, and then this function will return 0.

session : is a gnutls session

Returns : The Diffie-Hellman bit strength is returned, or 0 if no Diffie-Hellman key exchange was done, or a negative error code on failure.

gnutls_dh_get_group ()

```
int gnutls_dh_get_group (gnutls_session_t session,  
                        gnutls_datum_t *raw_gen,  
                        gnutls_datum_t *raw_prime);
```

This function will return the group parameters used in the last Diffie-Hellman key exchange with the peer. These are the prime and the generator used. This function should be used for both anonymous and ephemeral Diffie-Hellman. The output parameters must be freed with [gnutls_free\(\)](#).

session : is a gnutls session

raw_gen : will hold the generator.

raw_prime : will hold the prime.

Returns : On success, **GNUTLS_E_SUCCESS** (0) is returned, otherwise an error code is returned.

gnutls_dh_get_pubkey ()

```
int gnutls_dh_get_pubkey (gnutls_session_t session,  
                         gnutls_datum_t *raw_key);
```

This function will return the peer's public key used in the last Diffie-Hellman key exchange. This function should be used for both anonymous and ephemeral Diffie-Hellman. The output parameters must be freed with [gnutls_free\(\)](#).

session : is a gnutls session

raw_key : will hold the public key.

Returns : On success, **GNUTLS_E_SUCCESS** (0) is returned, otherwise an error code is returned.

gnutls_rsa_export_get_pubkey ()

```
int gnutls_rsa_export_get_pubkey (gnutls_session_t session,  
                                 gnutls_datum_t *exponent,  
                                 gnutls_datum_t *modulus);
```

This function will return the peer's public key exponent and modulus used in the last RSA-EXPORT authentication. The output parameters must be freed with [gnutls_free\(\)](#).

session : is a gnutls session

exponent : will hold the exponent.

modulus : will hold the modulus.

Returns : On success, **GNUTLS_E_SUCCESS** (0) is returned, otherwise an error code is returned.

gnutls_rsa_export_get_modulus_bits ()

```
int gnutls_rsa_export_get_modulus_bits (gnutls_session_t session);
```

Get the export RSA parameter's modulus size.

session : is a gnutls session

Returns : the bits used in the last RSA-EXPORT key exchange with the peer, or a negative value in case of error.

gnutls_certificate_set_retrieve_function ()

```
void gnutls_certificate_set_retrieve_function
(gnutls_certificate_credentials_t *cred,
 gnutls_certificate_retrieve_function *func);
```

This function sets a callback to be called in order to retrieve the certificate to be used in the handshake.

The callback's function prototype is: int (*callback)(gnutls_session_t, const gnutls_datum_t* req_ca_dn, int nreqs, const gnutls_pk_algos pk_algos, int pk_algos_length, gnutls_retr2_st* st);

req_ca_cert is only used in X.509 certificates. Contains a list with the CA names that the server considers trusted. Normally we should send a certificate that is signed by one of these CAs. These names are DER encoded. To get a more meaningful value use the function [gnutls_x509_rdn_get\(\)](#).

pk_algos contains a list with server's acceptable signature algorithms. The certificate returned should support the server's given algorithms.

st should contain the certificates and private keys.

If the callback function is provided then gnutls will call it, in the handshake, after the certificate request message has been received.

In server side *pk_algos* and *req_ca_dn* are NULL.

The callback function should set the certificate list to be sent, and return 0 on success. If no certificate was selected then the number of certificates should be set to zero. The value (-1) indicates error and the handshake will be terminated.

cred : is a [gnutls_certificate_credentials_t](#) structure.

func : is the callback function

gnutls_certificate_set_verify_function ()

```
void gnutls_certificate_set_verify_function
(gnutls_certificate_credentials_t *cred,
 gnutls_certificate_verify_function *func);
```

This function sets a callback to be called when peer's certificate has been received in order to verify it on receipt rather than doing after the handshake is completed.

The callback's function prototype is: int (*callback)(gnutls_session_t);

If the callback function is provided then gnutls will call it, in the handshake, just after the certificate message has been received. To verify or obtain the certificate the [gnutls_certificate_verify_peers2\(\)](#), [gnutls_certificate_type_get\(\)](#), [gnutls_certificate_get_peers\(\)](#) functions can be used.

The callback function should return 0 for the handshake to continue or non-zero to terminate.

cred : is a [gnutls_certificate_credentials_t](#) structure.

func : is the callback function

Since 2.10.0

gnutls_certificate_server_set_request ()

```
void gnutls_certificate_server_set_request
    (gnutls_session_t session,
     gnutls_certificate_request_t req);
```

This function specifies if we (in case of a server) are going to send a certificate request message to the client. If *req* is GNUTLS_CERT_REQUIRE then the server will return an error if the peer does not provide a certificate. If you do not call this function then the client will not be asked to send a certificate.

session : is a [gnutls_session_t](#) structure.

req : is one of GNUTLS_CERT_REQUEST, GNUTLS_CERT_REQUIRE

gnutls_certificate_get_peers ()

```
const gnutls_datum_t * gnutls_certificate_get_peers
    (gnutls_session_t session,
     unsigned int *list_size);
```

Get the peer's raw certificate (chain) as sent by the peer. These certificates are in raw format (DER encoded for X.509). In case of a X.509 then a certificate list may be present. The first certificate in the list is the peer's certificate, following the issuer's certificate, then the issuer's issuer etc.

In case of OpenPGP keys a single key will be returned in raw format.

session : is a gnutls session

list_size : is the length of the certificate list

Returns : return a pointer to a [gnutls_datum_t](#) containing our certificates, or **NULL** in case of an error or if no certificate was used.

gnutls_certificate_get_ours ()

```
const gnutls_datum_t * gnutls_certificate_get_ours
    (gnutls_session_t session);
```

Get the certificate as sent to the peer, in the last handshake. These certificates are in raw format. In X.509 this is a certificate list. In OpenPGP this is a single certificate.

session : is a gnutls session

Returns : return a pointer to a [gnutls_datum_t](#) containing our certificates, or **NULL** in case of an error or if no certificate was used.

gnutls_certificate_activation_time_peers ()

```
time_t gnutls_certificate_activation_time_peers
    (gnutls_session_t session);
```

**Warning**

`gnutls_certificate_activation_time_peers` is deprecated and should not be used in newly-written code. `gnutls_certificate_verify_peers2()` now verifies activation times.

This function will return the peer's certificate activation time. This is the creation time for openpgp keys.

session : is a gnutls session

Returns : (time_t)-1 on error.

gnutls_certificate_expiration_time_peers ()

```
time_t gnutls_certificate_expiration_time_peers(gnutls_session_t session);
```

**Warning**

`gnutls_certificate_expiration_time_peers` is deprecated and should not be used in newly-written code. `gnutls_certificate_verify_peers2()` now verifies expiration times.

This function will return the peer's certificate expiration time.

session : is a gnutls session

Returns : (time_t)-1 on error.

gnutls_certificate_client_get_request_status ()

```
int gnutls_certificate_client_get_request_status(gnutls_session_t session);
```

Get whether client certificate is requested or not.

session : is a gnutls session

Returns : 0 if the peer (server) did not request client authentication or 1 otherwise, or a negative value in case of error.

gnutls_certificate_verify_peers2 ()

```
int gnutls_certificate_verify_peers2(gnutls_session_t session, unsigned int *status);
```

This function will try to verify the peer's certificate and return its status (trusted, invalid etc.). The value of `status` should be one or more of the `gnutls_certificate_status_t` enumerated elements bitwise or'd. To avoid denial of service attacks some default upper limits regarding the certificate key size and chain size are set. To override them use `gnutls_certificate_set_verify_limits()`.

Note that you must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

This function uses `gnutls_x509_crt_list_verify()` with the CAs in the credentials as trusted CAs.

session : is a gnutls session

status : is the output of the verification

Returns : a negative error code on error and zero on success.

gnutls_certificate_verify_peers ()

```
int gnutls_certificate_verify_peers(gnutls_session_t session);
```

**Warning**

`gnutls_certificate_verify_peers` is deprecated and should not be used in newly-written code. Use `gnutls_certificate_verify_peers2()` instead.

This function will try to verify the peer's certificate and return its status (trusted, invalid etc.). However you must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

This function uses [gnutls_x509_crt_list_verify\(\)](#).

session : is a gnutls session

Returns : one or more of the [gnutls_certificate_status_t](#) enumerated elements bitwise or'd, or a negative value on error.

gnutls_pem_base64_encode ()

```
int gnutls_pem_base64_encode (const char *msg,  
                           const gnutls_datum_t *data,  
                           char *result,  
                           size_t *result_size);
```

This function will convert the given data to printable data, using the base64 encoding. This is the encoding used in PEM messages. The output string will be null terminated, although the size will not include the terminating null.

msg : is a message to be put in the header

data : contain the raw data

result : the place where base64 data will be copied

result_size : holds the size of the result

Returns : On success [GNUTLS_E_SUCCESS](#) (0) is returned, [GNUTLS_E_SHORT_MEMORY_BUFFER](#) is returned if the buffer given is not long enough, or 0 on success.

gnutls_pem_base64_decode ()

```
int gnutls_pem_base64_decode (const char *header,  
                           const gnutls_datum_t *b64_data,  
                           unsigned char *result,  
                           size_t *result_size);
```

This function will decode the given encoded data. If the header given is non null this function will search for "-----BEGIN header" and decode only this part. Otherwise it will decode the first PEM packet found.

header : A null terminated string with the PEM header (eg. CERTIFICATE)

b64_data : contain the encoded data

result : the place where decoded data will be copied

result_size : holds the size of the result

Returns : On success [GNUTLS_E_SUCCESS](#) (0) is returned, [GNUTLS_E_SHORT_MEMORY_BUFFER](#) is returned if the buffer given is not long enough, or 0 on success.

gnutls_pem_base64_encode_alloc ()

```
int gnutls_pem_base64_encode_alloc (const char *msg,
                                  const gnutls_datum_t *data,
                                  gnutls_datum_t *result);
```

This function will convert the given data to printable data, using the base64 encoding. This is the encoding used in PEM messages. This function will allocate the required memory to hold the encoded data.

You should use [gnutls_free\(\)](#) to free the returned data.

msg : is a message to be put in the encoded header

data : contains the raw data

result : will hold the newly allocated encoded data

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_pem_base64_decode_alloc ()

```
int gnutls_pem_base64_decode_alloc (const char *header,
                                  const gnutls_datum_t *b64_data,
                                  gnutls_datum_t *result);
```

This function will decode the given encoded data. The decoded data will be allocated, and stored into result. If the header given is non null this function will search for "-----BEGIN header" and decode only this part. Otherwise it will decode the first PEM packet found.

You should use [gnutls_free\(\)](#) to free the returned data.

header : The PEM header (eg. CERTIFICATE)

b64_data : contains the encoded data

result : the place where decoded data lie

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

GNUTLS_KEY_DIGITAL_SIGNATURE

```

gnutls_certificate_set_params_function ()

```
void gnutls_certificate_set_params_function
(gnutls_certificate_credentials_t *res,
gnutls_params_function *func);
```

This function will set a callback in order for the server to get the Diffie-Hellman or RSA parameters for certificate authentication. The callback should return zero on success.

res : is a gnutls_certificate_credentials_t structure

func : is the function to be called

gnutls_anon_set_params_function ()

```
void gnutls_anon_set_params_function
(gnutls_anon_server_credentials_t *res,
gnutls_params_function *func);
```

This function will set a callback in order for the server to get the Diffie-Hellman or RSA parameters for anonymous authentication. The callback should return zero on success.

res : is a gnutls_anon_server_credentials_t structure

func : is the function to be called

gnutls_psk_set_params_function ()

```
void gnutls_psk_set_params_function (gnutls_psk_server_credentials_t *res,
                                     gnutls_params_function *func);
```

This function will set a callback in order for the server to get the Diffie-Hellman or RSA parameters for PSK authentication. The callback should return zero on success.

res : is a gnutls_psk_server_credentials_t structure

func : is the function to be called

gnutls_hex2bin ()

```
int gnutls_hex2bin (const char *hex_data,
                     size_t hex_size,
                     char *bin_data,
                     size_t *bin_size);
```

Convert a buffer with hex data to binary data.

hex_data : string with data in hex format

hex_size : size of hex data

bin_data : output array with binary data

bin_size : when calling **bin_size* should hold size of *bin_data*, on return will hold actual size of *bin_data*.

Returns : GNUTLS_E_SUCCESS on success, otherwise an error.

Description

Details

GNUTLS_EXTRA_VERSION

```
#define GNUTLS_EXTRA_VERSION GNUTLS_VERSION
```

enum gnutls_ia_apptype_t

```
typedef enum
{
    GNUTLS_IA_APPLICATION_PAYLOAD = 0,
    GNUTLS_IA_INTERMEDIATE_PHASE_FINISHED = 1,
    GNUTLS_IA_FINAL_PHASE_FINISHED = 2
} gnutls_ia_apptype_t;
```

Enumeration of different certificate encoding formats.

GNUTLS_IA_APPLICATION_PAYLOAD TLS/IA application payload.

GNUTLS_IA_INTERMEDIATE_PHASE_FINISHED TLS/IA intermediate phase finished.

GNUTLS_IA_FINAL_PHASE_FINISHED TLS/IA final phase finished.

gnutls_ia_avp_func ()

int	(*gnutls_ia_avp_func)	(gnutls_session_t session,
		void *ptr,
		const char *last,
		size_t lastlen,
		char **next,
		size_t *nextlen);

session :

ptr :

last :

lastlen :

next :

nextlen :

Returns :

gnutls_ia_free_client_credentials ()

```
void gnutls_ia_free_client_credentials (gnutls_ia_client_credentials_t sc) ↵
;
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_ia_client_credentials_t](#) structure.

gnutls_ia_allocate_client_credentials ()

```
int gnutls_ia_allocate_client_credentials
    (gnutls_ia_client_credentials_t *sc ↪
     );
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

Adding this credential to a session will enable TLS/IA, and will require an Application Phase after the TLS handshake (if the server support TLS/IA). Use [gnutls_ia_enable\(\)](#) to toggle the TLS/IA mode.

sc : is a pointer to a [gnutls_ia_server_credentials_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_ia_free_server_credentials ()

```
void gnutls_ia_free_server_credentials (gnutls_ia_server_credentials_t sc) ↪
;
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

sc : is a [gnutls_ia_server_credentials_t](#) structure.

gnutls_ia_allocate_server_credentials ()

```
int gnutls_ia_allocate_server_credentials
    (gnutls_ia_server_credentials_t *sc ↪
     );
```

This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

Adding this credential to a session will enable TLS/IA, and will require an Application Phase after the TLS handshake (if the client support TLS/IA). Use [gnutls_ia_enable\(\)](#) to toggle the TLS/IA mode.

sc : is a pointer to a [gnutls_ia_server_credentials_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (0) is returned, otherwise an error code is returned.

gnutls_ia_set_client_avp_function ()

```
void gnutls_ia_set_client_avp_function (gnutls_ia_client_credentials_t ↪
    cred,
                                         gnutls_ia_avp_func avp_func);
```

Set the TLS/IA AVP callback handler used for the session.

The AVP callback is called to process AVPs received from the server, and to get a new AVP to send to the server.

The callback's function form is: int (*avp_func) (gnutls_session_t session, void *ptr, const char *last, size_t lastlen, char **next, size_t *nextlen);

The *session* parameter is the [gnutls_session_t](#) structure corresponding to the current session. The *ptr* parameter is the application hook pointer, set through [gnutls_ia_set_client_avp_ptr\(\)](#). The AVP received from the server is present in *last* of *lastlen* size, which will be [NULL](#) on the first invocation. The newly allocated output AVP to send to the server should be placed in **next* of **nextlen* size.

The callback may invoke [gnutls_ia_permute_inner_secret\(\)](#) to mix any generated session keys with the TLS/IA inner secret.

Return 0 ([GNUTLS_IA_APPLICATION_PAYLOAD](#)) on success, or a negative error code to abort the TLS/IA handshake.

Note that the callback must use allocate the *next* parameter using [gnutls_malloc\(\)](#), because it is released via [gnutls_free\(\)](#) by the TLS/IA handshake function.

cred: is a [gnutls_ia_client_credentials_t](#) structure.

avp_func: is the callback function

gnutls_ia_set_client_avp_ptr ()

```
void gnutls_ia_set_client_avp_ptr (gnutls_ia_client_credentials_t *  
    cred,  
    void *ptr);
```

Sets the pointer that will be provided to the TLS/IA callback function as the first argument.

cred: is a [gnutls_ia_client_credentials_t](#) structure.

ptr: is the pointer

gnutls_ia_get_client_avp_ptr ()

```
void * gnutls_ia_get_client_avp_ptr (gnutls_ia_client_credentials_t *  
    cred);
```

Returns the pointer that will be provided to the TLS/IA callback function as the first argument.

cred: is a [gnutls_ia_client_credentials_t](#) structure.

Returns : The client callback data pointer.

gnutls_ia_set_server_avp_function ()

```
void gnutls_ia_set_server_avp_function (gnutls_ia_server_credentials_t *  
    cred,  
    gnutls_ia_avp_func avp_func);
```

cred:

avp_func:

gnutls_ia_set_server_avp_ptr ()

```
void gnutls_ia_set_server_avp_ptr (gnutls_ia_server_credentials_t *  
    cred,  
    void *ptr);
```

Sets the pointer that will be provided to the TLS/IA callback function as the first argument.

cred: is a [gnutls_ia_client_credentials_t](#) structure.

ptr: is the pointer

gnutls_ia_get_server_avp_ptr ()

```
void * gnutls_ia_get_server_avp_ptr (gnutls_ia_server_credentials_t *  
    cred);
```

Returns the pointer that will be provided to the TLS/IA callback function as the first argument.

cred: is a [gnutls_ia_client_credentials_t](#) structure.

Returns : The server callback data pointer.

gnutls_ia_handshake_p ()

```
int gnutls_ia_handshake_p (gnutls_session_t session);
```

Predicate to be used after [gnutls_handshake\(\)](#) to decide whether to invoke [gnutls_ia_handshake\(\)](#). Usable by both clients and servers.

session : is a [gnutls_session_t](#) structure.

Returns : non-zero if TLS/IA handshake is expected, zero otherwise.

gnutls_ia_handshake ()

```
int gnutls_ia_handshake (gnutls_session_t session);
```

Perform a TLS/IA handshake. This should be called after [gnutls_handshake\(\)](#) iff [gnutls_ia_handshake_p\(\)](#).

session : is a [gnutls_session_t](#) structure.

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_ia_permute_inner_secret ()

```
int gnutls_ia_permute_inner_secret (gnutls_session_t session,
                                    size_t session_keys_size,
                                    const char *session_keys);
```

Permute the inner secret using the generated session keys.

This can be called in the TLS/IA AVP callback to mix any generated session keys with the TLS/IA inner secret.

session : is a [gnutls_session_t](#) structure.

session_keys_size : Size of generated session keys (0 if none).

session_keys : Generated session keys, used to permute inner secret (NULL if none).

Returns : Return zero on success, or a negative error code.

gnutls_ia_endphase_send ()

```
int gnutls_ia_endphase_send (gnutls_session_t session,
                            int final_p);
```

Send a TLS/IA end phase message.

In the client, this should only be used to acknowledge an end phase message sent by the server.

In the server, this can be called instead of [gnutls_ia_send\(\)](#) if the server wishes to end an application phase.

session : is a [gnutls_session_t](#) structure.

final_p : Set iff this should signal the final phase.

Returns : Return 0 on success, or an error code.

gnutls_ia_verify_endphase ()

int	gnutls_ia_verify_endphase	(gnutls_session_t session, const char *checksum);
-----	---------------------------	--

Verify TLS/IA end phase checksum data. If verification fails, the **GNUTLS_A_INNER_APPLICATION_VERIFICATION** alert is sent to the other side.

This function is called when `gnutls_ia_recv()` return **GNUTLS_E_WARNING_IA_IPHF RECEIVED** or **GNUTLS_E_WARNING_IA_**

session : is a `gnutls_session_t` structure.

checksum : 12-byte checksum data, received from `gnutls_ia_recv()`.

Returns : Return 0 on successful verification, or an error code. If the checksum verification of the end phase message fails, **GNUTLS_E_IA_VERIFY_FAILED** is returned.

gnutls_ia_send ()

ssize_t	gnutls_ia_send	(gnutls_session_t session, const char *data, size_t sizeofdata);
---------	----------------	--

Send TLS/IA application payload data. This function has the similar semantics with `send()`. The only difference is that it accepts a GnuTLS session, and uses different error codes.

The TLS/IA protocol is synchronous, so you cannot send more than one packet at a time. The client always sends the first packet.

To finish an application phase in the server, use `gnutls_ia_endphase_send()`. The client cannot end an application phase unilaterally; rather, a client is required to respond with an endphase of its own if `gnutls_ia_recv` indicates that the server has sent one.

If the EINTR is returned by the internal push function (the default is `send()`) then **GNUTLS_E_INTERRUPTED** will be returned. If **GNUTLS_E_INTERRUPTED** or **GNUTLS_E AGAIN** is returned, you must call this function again, with the same parameters; alternatively you could provide a **NULL** pointer for data, and 0 for size.

session : is a `gnutls_session_t` structure.

data : contains the data to send

sizeofdata : is the length of the data

Returns : The number of bytes sent, or a negative error code.

gnutls_ia_recv ()

ssize_t	gnutls_ia_recv	(gnutls_session_t session, char *data, size_t sizeofdata);
---------	----------------	--

Receive TLS/IA data. This function has the similar semantics with `recv()`. The only difference is that it accepts a GnuTLS session, and uses different error codes.

If the server attempt to finish an application phase, this function will return **GNUTLS_E_WARNING_IA_IPHF RECEIVED** or **GNUTLS_E_WARNING_IA_FPHF RECEIVED**. The caller should then invoke `gnutls_ia_verify_endphase()`, and if it runs the client side, also send an endphase message of its own using `gnutls_ia_endphase_send`.

If EINTR is returned by the internal push function (the default is `recv()`) then **GNUTLS_E_INTERRUPTED** will be returned. If **GNUTLS_E_INTERRUPTED** or **GNUTLS_E AGAIN** is returned, you must call this function again, with the same parameters; alternatively you could provide a **NULL** pointer for data, and 0 for size.

session: is a `gnutls_session_t` structure.

data: the buffer that the data will be read into, must hold ≥ 12 bytes.

sizeofdata: the number of requested bytes, must be ≥ 12 .

Returns : The number of bytes received. A negative error code is returned in case of an error. The `GNUTLS_E_WARNING_IA_IPHF_P` and `GNUTLS_E_WARNING_IA_FPHF_RECEIVED` errors are returned when an application phase finished message has been sent by the server.

`gnutls_ia_generate_challenge ()`

<code>int</code>	<code>gnutls_ia_generate_challenge</code>	<code>(gnutls_session_t session,</code>
		<code>size_t buffer_size,</code>
		<code>char *buffer);</code>

Generate an application challenge that the client cannot control or predict, based on the TLS/IA inner secret.

session: is a `gnutls_session_t` structure.

buffer_size: size of output buffer.

buffer: pre-allocated buffer to contain `buffer_size` bytes of output.

Returns : Returns 0 on success, or an negative error code.

`gnutls_ia_extract_inner_secret ()`

<code>void</code>	<code>gnutls_ia_extract_inner_secret</code>	<code>(gnutls_session_t session,</code>
		<code>char *buffer);</code>

Copy the 48 bytes large inner secret into the specified buffer

This function is typically used after the TLS/IA handshake has concluded. The TLS/IA inner secret can be used as input to a PRF to derive session keys. Do not use the inner secret directly as a session key, because for a resumed session that does not include an application phase, the inner secret will be identical to the inner secret in the original session. It is important to include, for example, the client and server randomness when deriving a session key from the inner secret.

session: is a `gnutls_session_t` structure.

buffer: pre-allocated buffer to hold 48 bytes of inner secret.

`gnutls_ia_enable ()`

<code>void</code>	<code>gnutls_ia_enable</code>	<code>(gnutls_session_t session,</code>
		<code>int allow_skip_on_resume);</code>

Specify whether we must advertise support for the TLS/IA extension during the handshake.

At the client side, we always advertise TLS/IA if `gnutls_ia_enable` was called before the handshake; at the server side, we also require that the client has advertised that it wants to run TLS/IA before including the advertisement, as required by the protocol.

Similarly, at the client side we always advertise that we allow TLS/IA to be skipped for resumed sessions if `allow_skip_on_resume` is non-zero; at the server side, we also require that the session is indeed resumable and that the client has also advertised that it allows TLS/IA to be skipped for resumed sessions.

After the TLS handshake, call `gnutls_ia_handshake_p()` to find out whether both parties agreed to do a TLS/IA handshake, before calling `gnutls_ia_handshake()` or one of the lower level `gnutls_ia_*` functions.

session: is a `gnutls_session_t` structure.

allow_skip_on_resume: non-zero if local party allows to skip the TLS/IA application phases for a resumed session.

gnutls_global_init_extra ()

```
int gnutls_global_init_extra (void);
```

This function initializes the global state of gnutls-extra library to defaults.

Note that [gnutls_global_init\(\)](#) has to be called before this function. If this function is not called then the gnutls-extra library will not be usable.

This function is not thread safe, see the discussion for [gnutls_global_init\(\)](#) on how to deal with that.

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_register_md5_handler ()

```
int gnutls_register_md5_handler (void);
```

Register a non-libgcrypt based MD5 and HMAC-MD5 handler. This is useful if you run Libgcrypt in FIPS-mode. Normally TLS requires use of MD5, so without this you cannot use GnuTLS with libgcrypt in FIPS mode.

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_extra_check_version ()

```
const char * gnutls_extra_check_version (const char *req_version);
```

Check GnuTLS Extra Library version.

See [GNUTLS_EXTRA_VERSION](#) for a suitable *req_version* string.

req_version : version string to compare with, or [NULL](#).

Returns : Check that the version of the library is at minimum the one given as a string in *req_version* and return the actual version string of the library; return [NULL](#) if the condition is not met. If [NULL](#) is passed to this function no check is done and only the version string is returned.

enum gnutls_certificate_import_flags

```
typedef enum gnutls_certificate_import_flags
{
    GNUTLS_X509_CRT_LIST_IMPORT_FAIL_IF_EXCEED = 1
} gnutls_certificate_import_flags;
```

Enumeration of different certificate import flags.

GNUTLS_X509_CRT_LIST_IMPORT_FAIL_IF_EXCEED Fail if the certificates in the buffer are more than the space allocated for certificates. The error code will be **GNUTLS_E_SHORT_MEMORY_BUFFER**.

gnutls_x509_crt_init ()

```
int gnutls_x509_crt_init (gnutls_x509_crt_t *cert);
```

This function will initialize an X.509 certificate structure.

cert : The structure to be initialized

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_deinit ()

```
void gnutls_x509_crt_deinit (gnutls_x509_crt_t cert);
```

This function will deinitialize a CRL structure.

cert : The structure to be initialized

gnutls_x509_crt_import ()

```
int gnutls_x509_crt_import (gnutls_x509_crt_t cert,
                           const gnutls_datum_t *data,
                           gnutls_x509_crt_fmt_t format);
```

This function will convert the given DER or PEM encoded Certificate to the native gnutls_x509_crt_t format. The output will be stored in *cert*.

If the Certificate is PEM encoded it should have a header of "X509 CERTIFICATE", or "CERTIFICATE".

cert : The structure to store the parsed certificate.

data : The DER or PEM encoded certificate.

format : One of DER or PEM

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_list_import ()

int	gnutls_x509_crt_list_import	(gnutls_x509_crt_t *certs, unsigned int *cert_max, const gnutls_datum_t *data, gnutls_x509_crt_fmt_t format, unsigned int flags);
-----	-----------------------------	---

This function will convert the given PEM encoded certificate list to the native `gnutls_x509_crt_t` format. The output will be stored in `certs`. They will be automatically initialized.

If the Certificate is PEM encoded it should have a header of "X509 CERTIFICATE", or "CERTIFICATE".

certs : The structures to store the parsed certificate. Must not be initialized.

cert_max : Initially must hold the maximum number of certs. It will be updated with the number of certs available.

data : The PEM encoded certificate.

format : One of DER or PEM.

flags : must be zero or an OR'd sequence of `gnutls_certificate_import_flags`.

Returns : the number of certificates read or a negative error value.

gnutls_x509_crt_export ()

int	gnutls_x509_crt_export	(gnutls_x509_crt_t cert, gnutls_x509_crt_fmt_t format, void *output_data, size_t *output_data_size);
-----	------------------------	---

This function will export the certificate to DER or PEM format.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN CERTIFICATE".

cert : Holds the certificate

format : the format of output params. One of PEM or DER.

output_data : will contain a certificate PEM or DER encoded

output_data_size : holds the size of `output_data` (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_x509_crt_get_issuer_dn ()

int	gnutls_x509_crt_get_issuer_dn	(gnutls_x509_crt_t cert, char *buf, size_t *sizeof_buf);
-----	-------------------------------	--

This function will copy the name of the Certificate issuer in the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If `buf` is null then only the size will be filled.

cert : should contain a `gnutls_x509_crt_t` structure

buf: a pointer to a structure to hold the name (may be null)

sizeof_buf: initially holds the size of *buf*

Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the **sizeof_buf* will be updated with the required size. On success 0 is returned.

`gnutls_x509_crt_get_issuer_dn_oid ()`

```
int gnutls_x509_crt_get_issuer_dn_oid (gnutls_x509_crt_t cert,
                                       int indx,
                                       void *oid,
                                       size_t *sizeof_oid);
```

This function will extract the OIDs of the name of the Certificate issuer specified by the given index.

If *oid* is null then only the size will be filled.

cert: should contain a `gnutls_x509_crt_t` structure

indx: This specifies which OID to return. Use zero to get the first one.

oid: a pointer to a buffer to hold the OID (may be null)

sizeof_oid: initially holds the size of *oid*

Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the **sizeof_oid* will be updated with the required size. On success 0 is returned.

`gnutls_x509_crt_get_issuer_dn_by_oid ()`

```
int gnutls_x509_crt_get_issuer_dn_by_oid (gnutls_x509_crt_t cert,
                                         const char *oid,
                                         int indx,
                                         unsigned int raw_flag,
                                         void *buf,
                                         size_t *sizeof_buf);
```

This function will extract the part of the name of the Certificate issuer specified by the given OID. The output, if the raw flag is not used, will be encoded as described in RFC2253. Thus a string that is ASCII or UTF-8 encoded, depending on the certificate data.

Some helper macros with popular OIDs can be found in gnutls/x509.h If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 -- in hex format with a '#' prefix. You can check about known OIDs using `gnutls_x509_dn_oid_known()`.

If *buf* is null then only the size will be filled.

cert: should contain a `gnutls_x509_crt_t` structure

oid: holds an Object Identified in null terminated string

indx: In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

raw_flag: If non zero returns the raw DER data of the DN part.

buf: a pointer to a structure to hold the name (may be null)

sizeof_buf: initially holds the size of *buf*

Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the **sizeof_buf* will be updated with the required size. On success 0 is returned.

gnutls_x509_crt_get_dn ()

```
int gnutls_x509_crt_get_dn (gnutls_x509_crt_t cert,
                           char *buf,
                           size_t *sizeof_buf);
```

This function will copy the name of the Certificate in the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If *buf* is null then only the size will be filled.

cert : should contain a [gnutls_x509_crt_t](#) structure

buf : a pointer to a structure to hold the name (may be null)

sizeof_buf : initially holds the size of *buf*

Returns : [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if the provided buffer is not long enough, and in that case the **sizeof_buf* will be updated with the required size. On success 0 is returned.

gnutls_x509_crt_get_dn_oid ()

```
int gnutls_x509_crt_get_dn_oid (gnutls_x509_crt_t cert,
                               int indx,
                               void *oid,
                               size_t *sizeof_oid);
```

This function will extract the OIDs of the name of the Certificate subject specified by the given index.

If *oid* is null then only the size will be filled.

cert : should contain a [gnutls_x509_crt_t](#) structure

indx : This specifies which OID to return. Use zero to get the first one.

oid : a pointer to a buffer to hold the OID (may be null)

sizeof_oid : initially holds the size of *oid*

Returns : [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if the provided buffer is not long enough, and in that case the **sizeof_oid* will be updated with the required size. On success 0 is returned.

gnutls_x509_crt_get_dn_by_oid ()

```
int gnutls_x509_crt_get_dn_by_oid (gnutls_x509_crt_t cert,
                                   const char *oid,
                                   int indx,
                                   unsigned int raw_flag,
                                   void *buf,
                                   size_t *sizeof_buf);
```

This function will extract the part of the name of the Certificate subject specified by the given OID. The output, if the raw flag is not used, will be encoded as described in RFC2253. Thus a string that is ASCII or UTF-8 encoded, depending on the certificate data.

Some helper macros with popular OIDs can be found in gnutls/x509.h If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 -- in hex format with a '#' prefix. You can check about known OIDs using [gnutls_x509_dn_oid_known\(\)](#).

If *buf* is null then only the size will be filled.

cert : should contain a `gnutls_x509_crt_t` structure

oid : holds an Object Identified in null terminated string

index : In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

raw_flag : If non zero returns the raw DER data of the DN part.

buf : a pointer where the DN part will be copied (may be null).

sizeof_buf : initially holds the size of *buf*

Returns : `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

`gnutls_x509_crt_check_hostname ()`

```
int gnutls_x509_crt_check_hostname (gnutls_x509_crt_t cert,
                                    const char *hostname);
```

This function will check if the given certificate's subject matches the given hostname. This is a basic implementation of the matching described in RFC2818 (HTTPS), which takes into account wildcards, and the DNSName/IPAddress subject alternative name PKIX extension.

cert : should contain an `gnutls_x509_crt_t` structure

hostname : A null terminated string that contains a DNS name

Returns : non zero for a successful match, and zero on failure.

`gnutls_x509_crt_get_signature_algorithm ()`

```
int gnutls_x509_crt_get_signature_algorithm (gnutls_x509_crt_t cert);
```

This function will return a value of the `gnutls_sign_algorithm_t` enumeration that is the signature algorithm that has been used to sign this certificate.

cert : should contain a `gnutls_x509_crt_t` structure

Returns : a `gnutls_sign_algorithm_t` value, or a negative value on error.

`gnutls_x509_crt_get_signature ()`

```
int gnutls_x509_crt_get_signature (gnutls_x509_crt_t cert,
                                  char *sig,
                                  size_t *sizeof_sig);
```

This function will extract the signature field of a certificate.

cert : should contain a `gnutls_x509_crt_t` structure

sig : a pointer where the signature part will be copied (may be null).

sizeof_sig : initially holds the size of *sig*

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value. and a negative value on error.

gnutls_x509_crt_get_version ()

```
int gnutls_x509_crt_get_version (gnutls_x509_crt_t cert);
```

This function will return the version of the specified Certificate.

cert : should contain a [gnutls_x509_crt_t](#) structure

Returns : version of certificate, or a negative value on error.

gnutls_x509_crt_get_key_id ()

```
int gnutls_x509_crt_get_key_id (gnutls_x509_crt_t crt,
                                unsigned int flags,
                                unsigned char *output_data,
                                size_t *output_data_size);
```

This function will return a unique ID the depends on the public key parameters. This ID can be used in checking whether a certificate corresponds to the given private key.

If the buffer provided is not long enough to hold the output, then *output_data_size is updated and GNUTLS_E_SHORT_MEMORY_BUFFER will be returned. The output will normally be a SHA-1 hash output, which is 20 bytes.

crt : Holds the certificate

flags : should be 0 for now

output_data : will contain the key ID

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_x509_crt_get_preferred_hash_algorithm ()

```
int gnutls_x509_crt_get_preferred_hash_algorithm (gnutls_x509_crt_t crt,
                                                 gnutls_digest_algorithm_t *hash,
                                                 unsigned int *mand);
```

This function will read the certificate and return the appropriate digest algorithm to use for signing with this certificate. Some certificates (i.e. DSA might not be able to sign without the preferred algorithm).

crt : Holds the certificate

hash : The result of the call with the hash algorithm used for signature

mand : If non zero it means that the algorithm MUST use this hash. May be NULL.

Returns : the 0 if the hash algorithm is found. A negative value is returned on error.

Since 2.11.0

gnutls_x509_crt_set_authority_key_id ()

```
int gnutls_x509_crt_set_authority_key_id
      (gnutls_x509_crt_t cert,
       const void *id,
       size_t id_size);
```

This function will set the X.509 certificate's authority key ID extension. Only the keyIdentifier field can be set with this function.

cert : a certificate of type [gnutls_x509_crt_t](#)

id : The key ID

id_size : Holds the size of the serial field.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_authority_key_id ()

```
int gnutls_x509_crt_get_authority_key_id
      (gnutls_x509_crt_t cert,
       void *ret,
       size_t *ret_size,
       unsigned int *critical);
```

This function will return the X.509v3 certificate authority's key identifier. This is obtained by the X.509 Authority Key identifier extension field (2.5.29.35). Note that this function only returns the keyIdentifier field of the extension.

cert : should contain a [gnutls_x509_crt_t](#) structure

ret : The place where the identifier will be copied

ret_size : Holds the size of the result field.

critical : will be non zero if the extension is marked as critical (may be null)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_subject_key_id ()

```
int gnutls_x509_crt_get_subject_key_id (gnutls_x509_crt_t cert,
                                         void *ret,
                                         size_t *ret_size,
                                         unsigned int *critical);
```

This function will return the X.509v3 certificate's subject key identifier. This is obtained by the X.509 Subject Key identifier extension field (2.5.29.14).

cert : should contain a [gnutls_x509_crt_t](#) structure

ret : The place where the identifier will be copied

ret_size : Holds the size of the result field.

critical : will be non zero if the extension is marked as critical (may be null)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_subject_unique_id ()

```
int gnutls_x509_crt_get_subject_unique_id
      (gnutls_x509_crt_t crt,
       char *buf,
       size_t *sizeof_buf);
```

This function will extract the subjectUniqueID value (if present) for the given certificate.

If the user allocated memory buffer is not large enough to hold the full subjectUniqueID, then a GNUTLS_E_SHORT_MEMORY_BUFFER error will be returned, and sizeof_buf will be set to the actual length.

crt : Holds the certificate

buf : user allocated memory buffer, will hold the unique id

sizeof_buf : size of user allocated memory buffer (on input), will hold actual size of the unique ID on return.

Returns : GNUTLS_E_SUCCESS on success, otherwise an error.

gnutls_x509_crt_get_issuer_unique_id ()

```
int gnutls_x509_crt_get_issuer_unique_id
      (gnutls_x509_crt_t crt,
       char *buf,
       size_t *sizeof_buf);
```

This function will extract the issuerUniqueID value (if present) for the given certificate.

If the user allocated memory buffer is not large enough to hold the full subjectUniqueID, then a GNUTLS_E_SHORT_MEMORY_BUFFER error will be returned, and sizeof_buf will be set to the actual length.

crt : Holds the certificate

buf : user allocated memory buffer, will hold the unique id

sizeof_buf : size of user allocated memory buffer (on input), will hold actual size of the unique ID on return.

Returns : GNUTLS_E_SUCCESS on success, otherwise an error.

GNUTLS_CRL_REASON_UNUSED

```
#define GNUTLS_CRL_REASON_UNUSED 128
```

GNUTLS_CRL_REASON_KEY_COMPROMISE

```
#define GNUTLS_CRL_REASON_KEY_COMPROMISE 64

GNUTLS_CRL_REASON_AA_COMPROMISE

```
#define GNUTLS_CRL_REASON_AA_COMPROMISE 32768
```

gnutls_x509_crt_get_crl_dist_points ()

```
int gnutls_x509_crt_get_crl_dist_points (gnutls_x509_crt_t cert,
                                         unsigned int seq,
                                         void *ret,
                                         size_t *ret_size,
                                         unsigned int *reason_flags,
                                         unsigned int *critical);
```

This function retrieves the CRL distribution points (2.5.29.31), contained in the given certificate in the X509v3 Certificate Extensions.

reason_flags should be an ORed sequence of **GNUTLS_CRL_REASON_UNUSED**, **GNUTLS_CRL_REASON_KEY_COMPROMISE**, **GNUTLS_CRL_REASON_CA_COMPROMISE**, **GNUTLS_CRL_REASON_AFFILIATION_CHANGED**, **GNUTLS_CRL_REASON_CESSATION_OF_OPERATION**, **GNUTLS_CRL_REASON_CERTIFICATE_HOLD**, **GNUTLS_CRL_REASON_AA_COMPROMISE**, or zero for all possible reasons.

cert : should contain a **gnutls_x509_crt_t** structure

seq : specifies the sequence number of the distribution point (0 for the first one, 1 for the second etc.)

ret : is the place where the distribution point will be copied to

ret_size : holds the size of ret.

reason_flags : Revocation reasons flags.

critical: will be non zero if the extension is marked as critical (may be null)

Returns : **GNUTLS_E_SHORT_MEMORY_BUFFER** and updates **&ret_size** if **&ret_size** is not enough to hold the distribution point, or the type of the distribution point if everything was ok. The type is one of the enumerated **gnutls_x509_subject_alt_name_t**. If the certificate does not have an Alternative name with the specified sequence number then **GNUTLS_E_REQUESTED_DATA_NOT_FOUND** is returned.

gnutls_x509_crt_set_crl_dist_points2 ()

```
int gnutls_x509_crt_set_crl_dist_points2
(gnutls_x509_crt_t crt,
gnutls_x509_subject_alt_name_t *type,
const void *data,
unsigned int data_size,
unsigned int reason_flags);
```

This function will set the CRL distribution points certificate extension.

crt : a certificate of type **gnutls_x509_crt_t**

type : is one of the **gnutls_x509_subject_alt_name_t** enumerations

data : The data to be set

data_size : The data size

reason_flags : revocation reasons

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.6.0

gnutls_x509_crt_set_crl_dist_points ()

```
int gnutls_x509_crt_set_crl_dist_points (gnutls_x509_crt_t crt,
gnutls_x509_subject_alt_name_t *type,
const void *data_string,
unsigned int reason_flags);
```

This function will set the CRL distribution points certificate extension.

crt : a certificate of type **gnutls_x509_crt_t**

type : is one of the **gnutls_x509_subject_alt_name_t** enumerations

data_string : The data to be set

reason_flags : revocation reasons

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_cpy_crl_dist_points ()

```
int gnutls_x509_crt_cpy_crl_dist_points (gnutls_x509_crt_t dst,  
                                         gnutls_x509_crt_t src);
```

This function will copy the CRL distribution points certificate extension, from the source to the destination certificate. This may be useful to copy from a CA certificate to issued ones.

dst : a certificate of type [gnutls_x509_crt_t](#)

src : the certificate where the dist points will be copied from

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_activation_time ()

```
time_t gnutls_x509_crt_get_activation_time (gnutls_x509_crt_t cert);
```

This function will return the time this Certificate was or will be activated.

cert : should contain a [gnutls_x509_crt_t](#) structure

Returns : activation time, or (time_t)-1 on error.

gnutls_x509_crt_get_expiration_time ()

```
time_t gnutls_x509_crt_get_expiration_time (gnutls_x509_crt_t cert);
```

This function will return the time this Certificate was or will be expired.

cert : should contain a [gnutls_x509_crt_t](#) structure

Returns : expiration time, or (time_t)-1 on error.

gnutls_x509_crt_get_serial ()

```
int gnutls_x509_crt_get_serial (gnutls_x509_crt_t cert,  
                                void *result,  
                                size_t *result_size);
```

This function will return the X.509 certificate's serial number. This is obtained by the X509 Certificate serialNumber field. Serial is not always a 32 or 64bit number. Some CAs use large serial numbers, thus it may be wise to handle it as something opaque.

cert : should contain a [gnutls_x509_crt_t](#) structure

result : The place where the serial number will be copied

result_size : Holds the size of the result field.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_pk_algorithm ()

```
int gnutls_x509_crt_get_pk_algorithm (gnutls_x509_crt_t cert,  
                                     unsigned int *bits);
```

This function will return the public key algorithm of an X.509 certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

cert : should contain a [gnutls_x509_crt_t](#) structure

bits : if bits is non null it will hold the size of the parameters' in bits

Returns : a member of the [gnutls_pk_algorithm_t](#) enumeration on success, or a negative value on error.

gnutls_x509_crt_get_pk_rsa_raw ()

```
int gnutls_x509_crt_get_pk_rsa_raw (gnutls_x509_crt_t crt,  
                                    gnutls_datum_t *m,  
                                    gnutls_datum_t *e);
```

This function will export the RSA public key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

m : will hold the modulus

e : will hold the public exponent

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

gnutls_x509_crt_get_pk_dsa_raw ()

```
int gnutls_x509_crt_get_pk_dsa_raw (gnutls_x509_crt_t crt,  
                                    gnutls_datum_t *p,  
                                    gnutls_datum_t *q,  
                                    gnutls_datum_t *g,  
                                    gnutls_datum_t *y);
```

This function will export the DSA public key's parameters found in the given certificate. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

p : will hold the p

q : will hold the q

g : will hold the g

y : will hold the y

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

gnutls_x509_crt_get_subject_alt_name ()

```
int gnutls_x509_crt_get_subject_alt_name
    (gnutls_x509_crt_t cert,
     unsigned int seq,
     void *ret,
     size_t *ret_size,
     unsigned int *critical);
```

This function retrieves the Alternative Name (2.5.29.17), contained in the given certificate in the X509v3 Certificate Extensions. When the SAN type is otherName, it will extract the data in the otherName's value field, and **GNUTLS_SAN_OTHERNAME** is returned. You may use [gnutls_x509_crt_get_subject_alt_othername_oid\(\)](#) to get the corresponding OID and the "virtual" SAN types (e.g., **GNUTLS_SAN_OTHERNAME_XMPP**).

If an otherName OID is known, the data will be decoded. Otherwise the returned data will be DER encoded, and you will have to decode it yourself. Currently, only the RFC 3920 id-on-xmppAddr SAN is recognized.

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the alternative name will be copied to

ret_size : holds the size of ret.

critical : will be non zero if the extension is marked as critical (may be null)

Returns : the alternative subject name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). It will return **GNUTLS_E_SHORT_MEMORY_BUFFER** if **ret_size** is not large enough to hold the value. In that case **ret_size** will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number then **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** is returned.

gnutls_x509_crt_get_subject_alt_name2 ()

```
int gnutls_x509_crt_get_subject_alt_name2
    (gnutls_x509_crt_t cert,
     unsigned int seq,
     void *ret,
     size_t *ret_size,
     unsigned int *ret_type,
     unsigned int *critical);
```

This function will return the alternative names, contained in the given certificate. It is the same as [gnutls_x509_crt_get_subject_alt_name](#) except for the fact that it will return the type of the alternative name in **ret_type** even if the function fails for some reason (i.e. the buffer provided is not enough).

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the alternative name will be copied to

ret_size : holds the size of ret.

ret_type : holds the type of the alternative name (one of [gnutls_x509_subject_alt_name_t](#)).

critical : will be non zero if the extension is marked as critical (may be null)

Returns : the alternative subject name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). It will return **GNUTLS_E_SHORT_MEMORY_BUFFER** if **ret_size** is not large enough to hold the value. In that case **ret_size** will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number then **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** is returned.

gnutls_x509_crt_get_subject_alt_othername_oid ()

```
int gnutls_x509_crt_get_subject_alt_othername_oid
    (gnutls_x509_crt_t cert,
     unsigned int seq,
     void *ret,
     size_t *ret_size);
```

This function will extract the type OID of an otherName Subject Alternative Name, contained in the given certificate, and return the type as an enumerated element.

This function is only useful if [gnutls_x509_crt_get_subject_alt_name\(\)](#) returned **GNUTLS_SAN_OTHERNAME**.

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the otherName OID will be copied to

ret_size : holds the size of ret.

Returns : the alternative subject name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). For supported OIDs, it will return one of the virtual (**GNUTLS_SAN_OTHERNAME_***) types, e.g. **GNUTLS_SAN_OTHERNAME_XMPP**, and **GNUTLS_SAN_OTHERNAME** for unknown OIDs. It will return **GNUTLS_E_SHORT_MEMORY_BUFFER** if **ret_size** is not large enough to hold the value. In that case **ret_size** will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number and with the otherName type then **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** is returned.

gnutls_x509_crt_get_issuer_alt_name ()

```
int gnutls_x509_crt_get_issuer_alt_name (gnutls_x509_crt_t cert,
                                         unsigned int seq,
                                         void *ret,
                                         size_t *ret_size,
                                         unsigned int *critical);
```

This function retrieves the Issuer Alternative Name (2.5.29.18), contained in the given certificate in the X509v3 Certificate Extensions.

When the SAN type is otherName, it will extract the data in the otherName's value field, and **GNUTLS_SAN_OTHERNAME** is returned. You may use [gnutls_x509_crt_get_subject_alt_othername_oid\(\)](#) to get the corresponding OID and the "virtual" SAN types (e.g., **GNUTLS_SAN_OTHERNAME_XMPP**).

If an otherName OID is known, the data will be decoded. Otherwise the returned data will be DER encoded, and you will have to decode it yourself. Currently, only the RFC 3920 id-on-xmppAddr Issuer AltName is recognized.

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the alternative name will be copied to

ret_size : holds the size of ret.

critical : will be non zero if the extension is marked as critical (may be null)

Returns : the alternative issuer name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). It will return **GNUTLS_E_SHORT_MEMORY_BUFFER** if **ret_size** is not large enough to hold the value. In that case **ret_size** will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number then **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** is returned.

Since 2.10.0

gnutls_x509_crt_get_issuer_alt_name2 ()

```
int gnutls_x509_crt_get_issuer_alt_name2
    (gnutls_x509_crt_t cert,
     unsigned int seq,
     void *ret,
     size_t *ret_size,
     unsigned int *ret_type,
     unsigned int *critical);
```

This function will return the alternative names, contained in the given certificate. It is the same as [gnutls_x509_crt_get_issuer_alt_name\(\)](#) except for the fact that it will return the type of the alternative name in *ret_type* even if the function fails for some reason (i.e. the buffer provided is not enough).

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the alternative name will be copied to

ret_size : holds the size of ret.

ret_type : holds the type of the alternative name (one of [gnutls_x509_subject_alt_name_t](#)).

critical : will be non zero if the extension is marked as critical (may be null)

Returns : the alternative issuer name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). It will return [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if *ret_size* is not large enough to hold the value. In that case *ret_size* will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number then [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) is returned.

Since 2.10.0

gnutls_x509_crt_get_issuer_alt_othername_oid ()

```
int gnutls_x509_crt_get_issuer_alt_othername_oid
    (gnutls_x509_crt_t cert,
     unsigned int seq,
     void *ret,
     size_t *ret_size);
```

This function will extract the type OID of an otherName Subject Alternative Name, contained in the given certificate, and return the type as an enumerated element.

This function is only useful if [gnutls_x509_crt_get_issuer_alt_name\(\)](#) returned [GNUTLS_SAN_OTHERNAME](#).

cert : should contain a [gnutls_x509_crt_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the otherName OID will be copied to

ret_size : holds the size of ret.

Returns : the alternative issuer name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). For supported OIDs, it will return one of the virtual ([GNUTLS_SAN_OTHERNAME_*](#)) types, e.g. [GNUTLS_SAN_OTHERNAME_XMPP](#), and [GNUTLS_SAN_OTHERNAME](#) for unknown OIDs. It will return [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if *ret_size* is not large enough to hold the value. In that case *ret_size* will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number and with the otherName type then [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) is returned.

Since 2.10.0

gnutls_x509_crt_get_ca_status ()

```
int gnutls_x509_crt_get_ca_status (gnutls_x509_crt_t cert,
                                  unsigned int *critical);
```

This function will return certificates CA status, by reading the basicConstraints X.509 extension (2.5.29.19). If the certificate is a CA a positive value will be returned, or zero if the certificate does not have CA flag set.

Use [gnutls_x509_crt_get_basic_constraints\(\)](#) if you want to read the pathLenConstraint field too.

cert : should contain a [gnutls_x509_crt_t](#) structure

critical : will be non zero if the extension is marked as critical

Returns : A negative value may be returned in case of parsing error. If the certificate does not contain the basicConstraints extension [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

gnutls_x509_crt_get_basic_constraints ()

```
int gnutls_x509_crt_get_basic_constraints (gnutls_x509_crt_t cert,
                                         unsigned int *critical,
                                         int *ca,
                                         int *pathlen);
```

This function will read the certificate's basic constraints, and return the certificates CA status. It reads the basicConstraints X.509 extension (2.5.29.19).

cert : should contain a [gnutls_x509_crt_t](#) structure

critical : will be non zero if the extension is marked as critical

ca : pointer to output integer indicating CA status, may be NULL, value is 1 if the certificate CA flag is set, 0 otherwise.

pathlen : pointer to output integer indicating path length (may be NULL), non-negative values indicate a present pathLenConstraint field and the actual value, -1 indicate that the field is absent.

Returns : If the certificate is a CA a positive value will be returned, or zero if the certificate does not have CA flag set. A negative value may be returned in case of errors. If the certificate does not contain the basicConstraints extension [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

gnutls_x509_crt_get_key_usage ()

```
int gnutls_x509_crt_get_key_usage (gnutls_x509_crt_t cert,
                                   unsigned int *key_usage,
                                   unsigned int *critical);
```

This function will return certificate's key usage, by reading the keyUsage X.509 extension (2.5.29.15). The key usage value will ORed values of the: [GNUTLS_KEY_DIGITAL_SIGNATURE](#), [GNUTLS_KEY_NON_REPUDIATION](#), [GNUTLS_KEY_KEY_ENCIPHERMENT](#), [GNUTLS_KEY_DATA_ENCIPHERMENT](#), [GNUTLS_KEY_KEY_AGREEMENT](#), [GNUTLS_KEY_KEY_CERT_SIGN](#), [GNUTLS_KEY_ENCIPHER_ONLY](#), [GNUTLS_KEY_DECIPHER_ONLY](#).

cert : should contain a [gnutls_x509_crt_t](#) structure

key_usage : where the key usage bits will be stored

critical : will be non zero if the extension is marked as critical

Returns : the certificate key usage, or a negative value in case of parsing error. If the certificate does not contain the keyUsage extension [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

gnutls_x509_crt_set_key_usage ()

int	gnutls_x509_crt_set_key_usage	(gnutls_x509_crt_t crt, unsigned int usage);
-----	-------------------------------	---

This function will set the keyUsage certificate extension.

crt : a certificate of type [gnutls_x509_crt_t](#)

usage : an ORed sequence of the GNUTLS_KEY_* elements.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_proxy ()

int	gnutls_x509_crt_get_proxy	(gnutls_x509_crt_t cert, unsigned int *critical, int *pathlen, char **policyLanguage, char **policy, size_t *sizeof_policy);
-----	---------------------------	---

This function will get information from a proxy certificate. It reads the ProxyCertInfo X.509 extension (1.3.6.1.5.5.7.1.14).

cert : should contain a [gnutls_x509_crt_t](#) structure

critical : will be non zero if the extension is marked as critical

pathlen : pointer to output integer indicating path length (may be NULL), non-negative values indicate a present pCPathLen-Constraint field and the actual value, -1 indicate that the field is absent.

policyLanguage : output variable with OID of policy language

policy : output variable with policy data

sizeof_policy : output variable size of policy data

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

gnutls_x509_dn_oid_known ()

int	gnutls_x509_dn_oid_known	(const char *oid);
-----	--------------------------	--------------------

This function will inform about known DN OIDs. This is useful since functions like [gnutls_x509_crt_set_dn_by_oid\(\)](#) use the information on known OIDs to properly encode their input. Object Identifiers that are not known are not encoded by these functions, and their input is stored directly into the ASN.1 structure. In that case of unknown OIDs, you have the responsibility of DER encoding your data.

oid : holds an Object Identifier in a null terminated string

Returns : 1 on known OIDs and 0 otherwise.

This function will return the requested extension OID in the certificate, and the critical flag for it. The extension OID will be stored as a string in the provided buffer. Use [gnutls_x509_crt_get_extension_data\(\)](#) to extract the data.

If the buffer provided is not long enough to hold the output, then `*sizeof_oid` is updated and [GNUTLS_E_SHORT_MEMORY_BUFFER](#) will be returned.

cert : should contain a [gnutls_x509_crt_t](#) structure

indx : Specifies which extension OID to send. Use zero to get the first one.

oid : a pointer to a structure to hold the OID

sizeof_oid : initially holds the maximum size of `oid`, on return holds actual size of `oid`.

critical : output variable with critical flag, may be NULL.

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned. If you have reached the last extension available [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

[gnutls_x509_crt_get_extension_data \(\)](#)

```
int gnutls_x509_crt_get_extension_data (gnutls_x509_crt_t cert,
                                         int indx,
                                         void *data,
                                         size_t *sizeof_data);
```

This function will return the requested extension data in the certificate. The extension data will be stored as a string in the provided buffer.

Use [gnutls_x509_crt_get_extension_info\(\)](#) to extract the OID and critical flag. Use [gnutls_x509_crt_get_extension_by_oid\(\)](#) instead, if you want to get data indexed by the extension OID rather than sequence.

cert : should contain a [gnutls_x509_crt_t](#) structure

indx : Specifies which extension OID to send. Use zero to get the first one.

data : a pointer to a structure to hold the data (may be null)

sizeof_data : initially holds the size of `oid`

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned. If you have reached the last extension available [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

[gnutls_x509_crt_set_extension_by_oid \(\)](#)

```
int gnutls_x509_crt_set_extension_by_oid (gnutls_x509_crt_t crt,
                                         const char *oid,
                                         const void *buf,
                                         size_t sizeof_buf,
                                         unsigned int critical);
```

This function will set an the extension, by the specified OID, in the certificate. The extension data should be binary data DER encoded.

crt : a certificate of type [gnutls_x509_crt_t](#)

oid : holds an Object Identified in null terminated string

buf : a pointer to a DER encoded data

sizeof_buf : holds the size of `buf`

critical : should be non zero if the extension is to be marked as critical

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_dn_by_oid ()

```
int gnutls_x509_crt_set_dn_by_oid (gnutls_x509_crt_t crt,  
                                  const char *oid,  
                                  unsigned int raw_flag,  
                                  const void *name,  
                                  unsigned int sizeof_name);
```

This function will set the part of the name of the Certificate subject, specified by the given OID. The input string should be ASCII or UTF-8 encoded.

Some helper macros with popular OIDs can be found in gnutls/x509.h With this function you can only set the known OIDs. You can test for known OIDs using [gnutls_x509_dn_oid_known\(\)](#). For OIDs that are not known (by gnutls) you should properly DER encode your data, and call this function with *raw_flag* set.

crt : a certificate of type [gnutls_x509_crt_t](#)

oid : holds an Object Identifier in a null terminated string

raw_flag : must be 0, or 1 if the data are DER encoded

name : a pointer to the name

sizeof_name : holds the size of *name*

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_issuer_dn_by_oid ()

```
int gnutls_x509_crt_set_issuer_dn_by_oid (gnutls_x509_crt_t crt,  
                                         const char *oid,  
                                         unsigned int raw_flag,  
                                         const void *name,  
                                         unsigned int sizeof_name);
```

This function will set the part of the name of the Certificate issuer, specified by the given OID. The input string should be ASCII or UTF-8 encoded.

Some helper macros with popular OIDs can be found in gnutls/x509.h With this function you can only set the known OIDs. You can test for known OIDs using [gnutls_x509_dn_oid_known\(\)](#). For OIDs that are not known (by gnutls) you should properly DER encode your data, and call this function with *raw_flag* set.

Normally you do not need to call this function, since the signing operation will copy the signer's name as the issuer of the certificate.

crt : a certificate of type [gnutls_x509_crt_t](#)

oid : holds an Object Identifier in a null terminated string

raw_flag : must be 0, or 1 if the data are DER encoded

name : a pointer to the name

sizeof_name : holds the size of *name*

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_version ()

```
int gnutls_x509_crt_set_version (gnutls_x509_crt_t crt,
                                unsigned int version);
```

This function will set the version of the certificate. This must be one for X.509 version 1, and so on. Plain certificates without extensions must have version set to one.

To create well-formed certificates, you must specify version 3 if you use any certificate extensions. Extensions are created by functions such as [gnutls_x509_crt_set_subject_alt_name\(\)](#) or [gnutls_x509_crt_set_key_usage\(\)](#).

crt : a certificate of type [gnutls_x509_crt_t](#)

version : holds the version number. For X.509v1 certificates must be 1.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_key ()

```
int gnutls_x509_crt_set_key (gnutls_x509_crt_t crt,
                            gnutls_x509_privkey_t key);
```

This function will set the public parameters from the given private key to the certificate. Only RSA keys are currently supported.

crt : a certificate of type [gnutls_x509_crt_t](#)

key : holds a private key

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_ca_status ()

```
int gnutls_x509_crt_set_ca_status (gnutls_x509_crt_t crt,
                                   unsigned int ca);
```

This function will set the basicConstraints certificate extension. Use [gnutls_x509_crt_set_basic_constraints\(\)](#) if you want to control the pathLenConstraint field too.

crt : a certificate of type [gnutls_x509_crt_t](#)

ca : true(1) or false(0). Depending on the Certificate authority status.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_basic_constraints ()

```
int gnutls_x509_crt_set_basic_constraints (gnutls_x509_crt_t crt,
                                         unsigned int ca,
                                         int pathLenConstraint);
```

This function will set the basicConstraints certificate extension.

crt : a certificate of type [gnutls_x509_crt_t](#)

ca : true(1) or false(0). Depending on the Certificate authority status.

pathLenConstraint : non-negative values indicate maximum length of path, and negative values indicate that the pathLenConstraints field should not be present.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_subject_alternative_name ()

```
int gnutls_x509_crt_set_subject_alternative_name
    (gnutls_x509_crt_t crt,
     gnutls_x509_subject_alt_name_t type,
     const char *data_string);
```

This function will set the subject alternative name certificate extension. This function assumes that data can be expressed as a null terminated string.

The name of the function is unfortunate since it is inconsistent with [gnutls_x509_crt_get_subject_alt_name\(\)](#).

crt : a certificate of type [gnutls_x509_crt_t](#)

type : is one of the [gnutls_x509_subject_alt_name_t](#) enumerations

data_string : The data to be set, a zero terminated string

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_subject_alt_name ()

```
int gnutls_x509_crt_set_subject_alt_name
    (gnutls_x509_crt_t crt,
     gnutls_x509_subject_alt_name_t type,
     const void *data,
     unsigned int data_size,
     unsigned int flags);
```

This function will set the subject alternative name certificate extension. It can set the following types:

`&GNUTLS_SAN_DNSNAME`: as a text string

`&GNUTLS_SAN_RFC822NAME`: as a text string

`&GNUTLS_SAN_URI`: as a text string

`&GNUTLS_SAN_IPADDRESS`: as a binary IP address (4 or 16 bytes)

Other values can be set as binary values with the proper DER encoding.

crt : a certificate of type [gnutls_x509_crt_t](#)

type : is one of the [gnutls_x509_subject_alt_name_t](#) enumerations

data : The data to be set

data_size : The size of data to be set

flags : [GNUTLS_FSAN_SET](#) to clear previous data or [GNUTLS_FSAN_APPEND](#) to append.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

Since 2.6.0

gnutls_x509_crt_sign ()

```
int gnutls_x509_crt_sign (gnutls_x509_crt_t crt,
                          gnutls_x509_crt_t issuer,
                          gnutls_privkey_t issuer_key);
```

This function is the same a [gnutls_x509_crt_sign2\(\)](#) with no flags, and SHA1 as the hash algorithm.

crt : a certificate of type [gnutls_x509_crt_t](#)

issuer : is the certificate of the certificate issuer

issuer_key : holds the issuer's private key

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_sign2 ()

```
int gnutls_x509_crt_sign2 (gnutls_x509_crt_t crt,
                           gnutls_x509_crt_t issuer,
                           gnutls_privkey_t issuer_key,
                           gnutls_digest_algorithm_t dig,
                           unsigned int flags);
```

This function will sign the certificate with the issuer's private key, and will copy the issuer's information into the certificate. This must be the last step in a certificate generation since all the previously set parameters are now signed.

crt : a certificate of type [gnutls_x509_crt_t](#)

issuer : is the certificate of the certificate issuer

issuer_key : holds the issuer's private key

dig : The message digest to use, [GNUTLS_DIG_SHA1](#) is a safe choice

flags : must be 0

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_activation_time ()

```
int gnutls_x509_crt_set_activation_time (gnutls_x509_crt_t cert,
                                         time_t act_time);
```

This function will set the time this Certificate was or will be activated.

cert : a certificate of type [gnutls_x509_crt_t](#)

act_time : The actual time

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_set_expiration_time ()

```
int gnutls_x509_crt_set_expiration_time (gnutls_x509_crt_t cert,  
                                         time_t exp_time);
```

This function will set the time this Certificate will expire.

cert : a certificate of type `gnutls_x509_crt_t`

exp_time : The actual time

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crt_set_serial ()

```
int gnutls_x509_crt_set_serial (gnutls_x509_crt_t cert,  
                               const void *serial,  
                               size_t serial_size);
```

This function will set the X.509 certificate's serial number. Serial is not always a 32 or 64bit number. Some CAs use large serial numbers, thus it may be wise to handle it as something opaque.

cert : a certificate of type `gnutls_x509_crt_t`

serial : The serial number

serial_size : Holds the size of the serial field.

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crt_set_subject_key_id ()

```
int gnutls_x509_crt_set_subject_key_id (gnutls_x509_crt_t cert,  
                                       const void *id,  
                                       size_t id_size);
```

This function will set the X.509 certificate's subject key ID extension.

cert : a certificate of type `gnutls_x509_crt_t`

id : The key ID

id_size : Holds the size of the serial field.

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crt_set_proxy_dn ()

```
int gnutls_x509_crt_set_proxy_dn (gnutls_x509_crt_t crt,  
                                 gnutls_x509_crt_t eecrt,  
                                 unsigned int raw_flag,  
                                 const void *name,  
                                 unsigned int sizeof_name);
```

This function will set the subject in `crt` to the end entity's `eecrt` subject name, and add a single Common Name component `name` of size `sizeof_name`. This corresponds to the required proxy certificate naming style. Note that if `name` is `NULL`, you MUST set it later by using `gnutls_x509_crt_set_dn_by_oid()` or similar.

crt : a gnutls_x509_crt_t structure with the new proxy cert

ee crt : the end entity certificate that will be issuing the proxy

raw_flag : must be 0, or 1 if the CN is DER encoded

name : a pointer to the CN name, may be NULL (but MUST then be added later)

sizeof_name : holds the size of *name*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_set_proxy ()

```
int gnutls_x509_crt_set_proxy (gnutls_x509_crt_t crt,
                               int pathLenConstraint,
                               const char *policyLanguage,
                               const char *policy,
                               size_t sizeof_policy);
```

This function will set the proxyCertInfo extension.

crt : a certificate of type **gnutls_x509_crt_t**

pathLenConstraint : non-negative values indicate maximum length of path, and negative values indicate that the pathLenConstraints field should not be present.

policyLanguage : OID describing the language of *policy*.

policy : opaque byte array with policy language, can be **NULL**

sizeof_policy : size of *policy*.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_print ()

```
int gnutls_x509_crt_print (gnutls_x509_crt_t cert,
                           gnutls_certificate_print_formats_t format,
                           gnutls_datum_t *out);
```

This function will pretty print a X.509 certificate, suitable for display to a human.

If the format is **GNUTLS_CRT_PRINT_FULL** then all fields of the certificate will be output, on multiple lines. The **GNUTLS_CRT_PRINTER** format will generate one line with some selected fields, which is useful for logging purposes.

The output *out* needs to be deallocate using **gnutls_free()**.

cert : The structure to be printed

format : Indicate the format to use

out : Newly allocated datum with zero terminated string.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_print ()

```
int gnutls_x509_crl_print (gnutls_x509_crl_t crl,
                           gnutls_certificate_print_formats_t format,
                           gnutls_datum_t *out);
```

This function will pretty print a X.509 certificate revocation list, suitable for display to a human.

The output *out* needs to be deallocate using [gnutls_free\(\)](#).

crl : The structure to be printed

format : Indicate the format to use

out : Newly allocated datum with zero terminated string.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_get_raw_issuer_dn ()

```
int gnutls_x509_crt_get_raw_issuer_dn (gnutls_x509_crt_t cert,
                                       gnutls_datum_t *start);
```

This function will return a pointer to the DER encoded DN structure and the length.

cert : should contain a [gnutls_x509_crt_t](#) structure

start : will hold the starting point of the DN

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.or a negative value on error.

gnutls_x509_crt_get_raw_dn ()

```
int gnutls_x509_crt_get_raw_dn (gnutls_x509_crt_t cert,
                                gnutls_datum_t *start);
```

This function will return a pointer to the DER encoded DN structure and the length.

cert : should contain a [gnutls_x509_crt_t](#) structure

start : will hold the starting point of the DN

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value. or a negative value on error.

gnutls_x509_rdn_get ()

```
int gnutls_x509_rdn_get (const gnutls_datum_t *idn,
                        char *buf,
                        size_t *sizeof_buf);
```

This function will return the name of the given RDN sequence. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253.

idn : should contain a DER encoded RDN sequence

buf : a pointer to a structure to hold the peer's name

sizeof_buf : holds the size of *buf*

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, or [GNUTLS_E_SHORT_MEMORY_BUFFER](#) is returned and **sizeof_buf* is updated if the provided buffer is not long enough, otherwise a negative error value.

gnutls_x509_rdn_get_oid ()

```
int gnutls_x509_rdn_get_oid (const gnutls_datum_t *idn,  
                           int indx,  
                           void *buf,  
                           size_t *sizeof_buf);
```

This function will return the specified Object identifier, of the RDN sequence.

idn : should contain a DER encoded RDN sequence

indx : Indicates which OID to return. Use 0 for the first one.

buf : a pointer to a structure to hold the peer's name OID

sizeof_buf : holds the size of *buf*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, or **GNUTLS_E_SHORT_MEMORY_BUFFER** is returned and **sizeof_buf* is updated if the provided buffer is not long enough, otherwise a negative error value.

Since 2.4.0

gnutls_x509_rdn_get_by_oid ()

```
int gnutls_x509_rdn_get_by_oid (const gnutls_datum_t *idn,  
                               const char *oid,  
                               int indx,  
                               unsigned int raw_flag,  
                               void *buf,  
                               size_t *sizeof_buf);
```

This function will return the name of the given Object identifier, of the RDN sequence. The name will be encoded using the rules from RFC2253.

idn : should contain a DER encoded RDN sequence

oid : an Object Identifier

indx : In case multiple same OIDs exist in the RDN indicates which to send. Use 0 for the first one.

raw_flag : If non zero then the raw DER data are returned.

buf : a pointer to a structure to hold the peer's name

sizeof_buf : holds the size of *buf*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, or **GNUTLS_E_SHORT_MEMORY_BUFFER** is returned and **sizeof_buf* is updated if the provided buffer is not long enough, otherwise a negative error value.

gnutls_x509_dn_t

```
typedef void *gnutls_x509_dn_t;
```

gnutls_x509_crt_get_subject ()

```
int gnutls_x509_crt_get_subject (gnutls_x509_crt_t cert,  
                                gnutls_x509_dn_t *dn);
```

Return the Certificate's Subject DN as an opaque data type. You may use [gnutls_x509_dn_get_rdn_ava\(\)](#) to decode the DN.

Note that *dn* should be treated as constant. Because points into the *cert* object, you may not deallocate *cert* and continue to access *dn*.

cert : should contain a [gnutls_x509_crt_t](#) structure

dn : output variable with pointer to opaque DN.

Returns : Returns 0 on success, or an error code.

gnutls_x509_crt_get_issuer ()

```
int gnutls_x509_crt_get_issuer (gnutls_x509_crt_t cert,  
                                gnutls_x509_dn_t *dn);
```

Return the Certificate's Issuer DN as an opaque data type. You may use [gnutls_x509_dn_get_rdn_ava\(\)](#) to decode the DN.

Note that *dn* should be treated as constant. Because points into the *cert* object, you may not deallocate *cert* and continue to access *dn*.

cert : should contain a [gnutls_x509_crt_t](#) structure

dn : output variable with pointer to opaque DN

Returns : Returns 0 on success, or an error code.

gnutls_x509_dn_get_rdn_ava ()

```
int gnutls_x509_dn_get_rdn_ava (gnutls_x509_dn_t dn,  
                                int irdn,  
                                int iava,  
                                gnutls_x509_ava_st *ava);
```

Get pointers to data within the DN.

Note that *ava* will contain pointers into the *dn* structure, so you should not modify any data or deallocate it. Note also that the DN in turn points into the original certificate structure, and thus you may not deallocate the certificate and continue to access *dn*.

dn : input variable with opaque DN pointer

irdn : index of RDN

iava : index of AVA.

ava : Pointer to structure which will hold output information.

Returns : Returns 0 on success, or an error code.

gnutls_x509_dn_init ()

```
int gnutls_x509_dn_init (gnutls_x509_dn_t *dn);
```

This function initializes a [gnutls_x509_dn_t](#) structure.

The object returned must be deallocated using [gnutls_x509_dn_deinit\(\)](#).

dn : the object to be initialized

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

Since 2.4.0

gnutls_x509_dn_import ()

```
int gnutls_x509_dn_import (gnutls_x509_dn_t dn,
                           const gnutls_datum_t *data);
```

This function parses an RDN sequence and stores the result to a [gnutls_x509_dn_t](#) structure. The structure must have been initialized with [gnutls_x509_dn_init\(\)](#). You may use [gnutls_x509_dn_get_rdn_ava\(\)](#) to decode the DN.

dn : the structure that will hold the imported DN

data : should contain a DER encoded RDN sequence

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

Since 2.4.0

gnutls_x509_dn_export ()

```
int gnutls_x509_dn_export (gnutls_x509_dn_t dn,
                           gnutls_x509_crt_fmt_t format,
                           void *output_data,
                           size_t *output_data_size);
```

This function will export the DN to DER or PEM format.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and [GNUTLS_E_SHORT_MEMORY](#) will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN NAME".

dn : Holds the opaque DN object

format : the format of output params. One of PEM or DER.

output_data : will contain a DN PEM or DER encoded

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_dn_deinit ()

```
void gnutls_x509_dn_deinit (gnutls_x509_dn_t dn);
```

This function deallocates the DN object as returned by [gnutls_x509_dn_import\(\)](#).

dn : a DN opaque object pointer.

Since 2.4.0

gnutls_x509_crl_init ()

```
int gnutls_x509_crl_init (gnutls_x509_crl_t *crl);
```

This function will initialize a CRL structure. CRL stands for Certificate Revocation List. A revocation list usually contains lists of certificate serial numbers that have been revoked by an Authority. The revocation lists are always signed with the authority's private key.

crl : The structure to be initialized

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crl_deinit ()

```
void gnutls_x509_crl_deinit (gnutls_x509_crl_t crl);
```

This function will deinitialize a CRL structure.

crl : The structure to be initialized

gnutls_x509_crl_import ()

```
int gnutls_x509_crl_import (gnutls_x509_crl_t crl,
                           const gnutls_datum_t *data,
                           gnutls_x509_crt_fmt_t format);
```

This function will convert the given DER or PEM encoded CRL to the native [gnutls_x509_crl_t](#) format. The output will be stored in 'crl'.

If the CRL is PEM encoded it should have a header of "X509 CRL".

crl : The structure to store the parsed CRL.

data : The DER or PEM encoded CRL.

format : One of DER or PEM

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crl_export ()

```
int gnutls_x509_crl_export (gnutls_x509_crl_t crl,
                           gnutls_x509_crt_fmt_t format,
                           void *output_data,
                           size_t *output_data_size);
```

This function will export the revocation list to DER or PEM format.

If the buffer provided is not long enough to hold the output, then **GNUTLS_E_SHORT_MEMORY_BUFFER** will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN X509 CRL".

crl : Holds the revocation list

format : the format of output params. One of PEM or DER.

output_data : will contain a private key PEM or DER encoded

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value. and a negative value on failure.

gnutls_x509_crl_get_issuer_dn ()

```
int gnutls_x509_crl_get_issuer_dn (const gnutls_x509_crl_t crl,
                                   char *buf,
                                   size_t *sizeof_buf);
```

This function will copy the name of the CRL issuer in the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If buf is **NULL** then only the size will be filled.

crl : should contain a `gnutls_x509_crl_t` structure

buf : a pointer to a structure to hold the peer's name (may be null)

sizeof_buf : initially holds the size of **buf**

Returns : **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the `sizeof_buf` will be updated with the required size, and 0 on success.

gnutls_x509_crl_get_issuer_dn_by_oid ()

```
int gnutls_x509_crl_get_issuer_dn_by_oid (gnutls_x509_crl_t crl,
                                         const char *oid,
                                         int indx,
                                         unsigned int raw_flag,
                                         void *buf,
                                         size_t *sizeof_buf);
```

This function will extract the part of the name of the CRL issuer specified by the given OID. The output will be encoded as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

Some helper macros with popular OIDs can be found in `gnutls/x509.h`. If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 -- in hex format with a '#' prefix. You can check about known OIDs using `gnutls_x509_dn_oid_known()`.

If buf is null then only the size will be filled.

crl: should contain a gnutls_x509_crl_t structure

oid: holds an Object Identified in null terminated string

indx: In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

raw_flag: If non zero returns the raw DER data of the DN part.

buf: a pointer to a structure to hold the peer's name (may be null)

sizeof_buf: initially holds the size of *buf*

Returns: **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the sizeof_buf will be updated with the required size, and 0 on success.

gnutls_x509_crl_get_dn_oid ()

```
int gnutls_x509_crl_get_dn_oid (gnutls_x509_crl_t crl,
                                int indx,
                                void *oid,
                                size_t *sizeof_oid);
```

This function will extract the requested OID of the name of the CRL issuer, specified by the given index.

If oid is null then only the size will be filled.

crl: should contain a gnutls_x509_crl_t structure

indx: Specifies which DN OID to send. Use zero to get the first one.

oid: a pointer to a structure to hold the name (may be null)

sizeof_oid: initially holds the size of 'oid'

Returns: **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the sizeof_oid will be updated with the required size. On success 0 is returned.

gnutls_x509_crl_get_signature_algorithm ()

```
int gnutls_x509_crl_get_signature_algorithm (gnutls_x509_crl_t crl);
```

This function will return a value of the [gnutls_sign_algorithm_t](#) enumeration that is the signature algorithm.

crl: should contain a [gnutls_x509_crl_t](#) structure

Returns: On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_get_signature ()

```
int gnutls_x509_crl_get_signature (gnutls_x509_crl_t crl,
                                   char *sig,
                                   size_t *sizeof_sig);
```

This function will extract the signature field of a CRL.

crl: should contain a gnutls_x509_crl_t structure

sig: a pointer where the signature part will be copied (may be null).

sizeof_sig: initially holds the size of *sig*

Returns: On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value. and a negative value on error.

gnutls_x509_crl_get_version ()

```
int gnutls_x509_crl_get_version (gnutls_x509_crl_t crl);
```

This function will return the version of the specified CRL.

crl : should contain a [gnutls_x509_crl_t](#) structure

Returns : The version number, or a negative value on error.

gnutls_x509_crl_get_this_update ()

```
time_t gnutls_x509_crl_get_this_update (gnutls_x509_crl_t crl);
```

This function will return the time this CRL was issued.

crl : should contain a [gnutls_x509_crl_t](#) structure

Returns : when the CRL was issued, or (time_t)-1 on error.

gnutls_x509_crl_get_next_update ()

```
time_t gnutls_x509_crl_get_next_update (gnutls_x509_crl_t crl);
```

This function will return the time the next CRL will be issued. This field is optional in a CRL so it might be normal to get an error instead.

crl : should contain a [gnutls_x509_crl_t](#) structure

Returns : when the next CRL will be issued, or (time_t)-1 on error.

gnutls_x509_crl_get_crt_count ()

```
int gnutls_x509_crl_get_crt_count (gnutls_x509_crl_t crl);
```

This function will return the number of revoked certificates in the given CRL.

crl : should contain a [gnutls_x509_crl_t](#) structure

Returns : number of certificates, a negative value on failure.

gnutls_x509_crl_get_crt_serial ()

```
int gnutls_x509_crl_get_crt_serial (gnutls_x509_crl_t crl,
                                    int indx,
                                    unsigned char *serial,
                                    size_t *serial_size,
                                    time_t *t);
```

This function will retrieve the serial number of the specified, by the index, revoked certificate.

crl : should contain a [gnutls_x509_crl_t](#) structure

indx : the index of the certificate to extract (starting from 0)

serial : where the serial number will be copied

serial_size : initially holds the size of serial

t : if non null, will hold the time this certificate was revoked

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value. and a negative value on error.

gnutls_x509_crl_get_certificate_count

```
#define gnutls_x509_crl_get_certificate_count gnutls_x509_crl_get_crt_count
```

gnutls_x509_crl_get_certificate

```
#define gnutls_x509_crl_get_certificate gnutls_x509_crl_get_crt_serial
```

gnutls_x509_crl_check_issuer ()

```
int gnutls_x509_crl_check_issuer (gnutls_x509_crl_t crl,  
                                 gnutls_x509_crt_t issuer);
```

This function will check if the given CRL was issued by the given issuer certificate. It will return true (1) if the given CRL was issued by the given issuer, and false (0) if not.

crl : is the CRL to be checked

issuer : is the certificate of a possible issuer

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_set_version ()

```
int gnutls_x509_crl_set_version (gnutls_x509_crl_t crl,  
                                 unsigned int version);
```

This function will set the version of the CRL. This must be one for CRL version 1, and so on. The CRLs generated by gnutls should have a version number of 2.

crl : should contain a gnutls_x509_crl_t structure

version : holds the version number. For CRLv1 crls must be 1.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_sign ()

```
int gnutls_x509_crl_sign (gnutls_x509_crl_t crl,  
                         gnutls_x509_crt_t issuer,  
                         gnutls_x509_privkey_t issuer_key);
```

This function is the same a **gnutls_x509_crl_sign2()** with no flags, and SHA1 as the hash algorithm.

crl : should contain a gnutls_x509_crl_t structure

issuer : is the certificate of the certificate issuer

issuer_key : holds the issuer's private key

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_sign2 ()

```
int gnutls_x509_crl_sign2(gnutls_x509_crl_t crl,  
                           gnutls_x509_crt_t issuer,  
                           gnutls_privkey_t issuer_key,  
                           gnutls_digest_algorithm_t dig,  
                           unsigned int flags);
```

This function will sign the CRL with the issuer's private key, and will copy the issuer's information into the CRL.

This must be the last step in a certificate CRL since all the previously set parameters are now signed.

crl : should contain a `gnutls_x509_crl_t` structure

issuer : is the certificate of the certificate issuer

issuer_key : holds the issuer's private key

dig : The message digest to use. GNUTLS_DIG_SHA1 is the safe choice unless you know what you're doing.

flags : must be 0

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crl_set_this_update ()

```
int gnutls_x509_crl_set_this_update(gnutls_x509_crl_t crl,  
                                    time_t act_time);
```

This function will set the time this CRL was issued.

crl : should contain a `gnutls_x509_crl_t` structure

act_time : The actual time

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crl_set_next_update ()

```
int gnutls_x509_crl_set_next_update(gnutls_x509_crl_t crl,  
                                    time_t exp_time);
```

This function will set the time this CRL will be updated.

crl : should contain a `gnutls_x509_crl_t` structure

exp_time : The actual time

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crl_set_crt_serial ()

```
int gnutls_x509_crl_set_crt_serial (gnutls_x509_crl_t crl,  
                                   const void *serial,  
                                   size_t serial_size,  
                                   time_t revocation_time);
```

This function will set a revoked certificate's serial number to the CRL.

crl: should contain a `gnutls_x509_crl_t` structure

serial: The revoked certificate's serial number

serial_size: Holds the size of the serial field.

revocation_time: The time this certificate was revoked

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crl_set_crt ()

```
int gnutls_x509_crl_set_crt (gnutls_x509_crl_t crl,  
                            gnutls_x509_crt_t crt,  
                            time_t revocation_time);
```

This function will set a revoked certificate's serial number to the CRL.

crl: should contain a `gnutls_x509_crl_t` structure

crt: a certificate of type `gnutls_x509_crt_t` with the revoked certificate

revocation_time: The time this certificate was revoked

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crl_get_authority_key_id ()

```
int gnutls_x509_crl_get_authority_key_id (gnutls_x509_crl_t crl,  
                                         void *ret,  
                                         size_t *ret_size,  
                                         unsigned int *critical);
```

This function will return the CRL authority's key identifier. This is obtained by the X.509 Authority Key identifier extension field (2.5.29.35). Note that this function only returns the keyIdentifier field of the extension.

crl: should contain a `gnutls_x509_crl_t` structure

ret: The place where the identifier will be copied

ret_size: Holds the size of the result field.

critical: will be non zero if the extension is marked as critical (may be null)

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error.

Since 2.8.0

gnutls_x509_crl_get_number ()

```
int gnutls_x509_crl_get_number (gnutls_x509_crl_t crl,
                               void *ret,
                               size_t *ret_size,
                               unsigned int *critical);
```

This function will return the CRL number extension. This is obtained by the CRL Number extension field (2.5.29.20).

crl : should contain a `gnutls_x509_crl_t` structure

ret : The place where the number will be copied

ret_size : Holds the size of the result field.

critical : will be non zero if the extension is marked as critical (may be null)

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error.

Since 2.8.0

gnutls_x509_crl_get_extension_oid ()

```
int gnutls_x509_crl_get_extension_oid (gnutls_x509_crl_t crl,
                                       int indx,
                                       void *oid,
                                       size_t *sizeof_oid);
```

This function will return the requested extension OID in the CRL. The extension OID will be stored as a string in the provided buffer.

crl : should contain a `gnutls_x509_crl_t` structure

indx : Specifies which extension OID to send, use zero to get the first one.

oid : a pointer to a structure to hold the OID (may be null)

sizeof_oid : initially holds the size of **oid**

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If your have reached the last extension available `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since 2.8.0

gnutls_x509_crl_get_extension_info ()

```
int gnutls_x509_crl_get_extension_info (gnutls_x509_crl_t crl,
                                       int indx,
                                       void *oid,
                                       size_t *sizeof_oid,
                                       int *critical);
```

This function will return the requested extension OID in the CRL, and the critical flag for it. The extension OID will be stored as a string in the provided buffer. Use `gnutls_x509_crl_get_extension_data()` to extract the data.

If the buffer provided is not long enough to hold the output, then `*sizeof_oid` is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned.

crl : should contain a `gnutls_x509_crl_t` structure

indx: Specifies which extension OID to send, use zero to get the first one.

oid: a pointer to a structure to hold the OID

sizeof_oid: initially holds the maximum size of *oid*, on return holds actual size of *oid*.

critical: output variable with critical flag, may be NULL.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative value in case of an error. If you have reached the last extension available **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** will be returned.

Since 2.8.0

gnutls_x509_crl_get_extension_data ()

```
int gnutls_x509_crl_get_extension_data (gnutls_x509_crl_t crl,  
                                      int indx,  
                                      void *data,  
                                      size_t *sizeof_data);
```

This function will return the requested extension data in the CRL. The extension data will be stored as a string in the provided buffer.

Use [gnutls_x509_crl_get_extension_info\(\)](#) to extract the OID and critical flag. Use [gnutls_x509_crl_get_extension_info\(\)](#) instead, if you want to get data indexed by the extension OID rather than sequence.

crl: should contain a [gnutls_x509_crl_t](#) structure

indx: Specifies which extension OID to send. Use zero to get the first one.

data: a pointer to a structure to hold the data (may be null)

sizeof_data: initially holds the size of *oid*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative value in case of an error. If you have reached the last extension available **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** will be returned.

Since 2.8.0

gnutls_x509_crl_set_authority_key_id ()

```
int gnutls_x509_crl_set_authority_key_id (gnutls_x509_crl_t crl,  
                                         const void *id,  
                                         size_t id_size);
```

This function will set the CRL's authority key ID extension. Only the keyIdentifier field can be set with this function.

crl: a CRL of type [gnutls_x509_crl_t](#)

id: The key ID

id_size: Holds the size of the serial field.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.8.0

gnutls_x509_crl_set_number ()

```
int gnutls_x509_crl_set_number (gnutls_x509_crl_t crl,  
                               const void *nr,  
                               size_t nr_size);
```

This function will set the CRL's number extension.

crl : a CRL of type `gnutls_x509_crl_t`

nr : The CRL number

nr_size : Holds the size of the nr field.

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since 2.8.0

struct gnutls_pkcs7_int

```
struct gnutls_pkcs7_int;
```

gnutls_pkcs7_t

```
typedef struct gnutls_pkcs7_int *gnutls_pkcs7_t;
```

gnutls_pkcs7_init ()

```
int gnutls_pkcs7_init (gnutls_pkcs7_t *pkcs7);
```

This function will initialize a PKCS7 structure. PKCS7 structures usually contain lists of X.509 Certificates and X.509 Certificate revocation lists.

pkcs7 : The structure to be initialized

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs7_deinit ()

```
void gnutls_pkcs7_deinit (gnutls_pkcs7_t pkcs7);
```

This function will deinitialize a PKCS7 structure.

pkcs7 : The structure to be initialized

gnutls_pkcs7_import ()

```
int gnutls_pkcs7_import (gnutls_pkcs7_t pkcs7,  
                         const gnutls_datum_t *data,  
                         gnutls_x509_crt_fmt_t format);
```

This function will convert the given DER or PEM encoded PKCS7 to the native [gnutls_pkcs7_t](#) format. The output will be stored in *pkcs7*.

If the PKCS7 is PEM encoded it should have a header of "PKCS7".

pkcs7 : The structure to store the parsed PKCS7.

data : The DER or PEM encoded PKCS7.

format : One of DER or PEM

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs7_export ()

```
int gnutls_pkcs7_export (gnutls_pkcs7_t pkcs7,  
                         gnutls_x509_crt_fmt_t format,  
                         void *output_data,  
                         size_t *output_data_size);
```

This function will export the *pkcs7* structure to DER or PEM format.

If the buffer provided is not long enough to hold the output, then **output_data_size* is updated and [GNUTLS_E_SHORT_MEMORY](#) will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN PKCS7".

pkcs7 : Holds the *pkcs7* structure

format : the format of output params. One of PEM or DER.

output_data : will contain a structure PEM or DER encoded

output_data_size : holds the size of *output_data* (and will be replaced by the actual size of parameters)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs7_get_crt_count ()

```
int gnutls_pkcs7_get_crt_count (gnutls_pkcs7_t pkcs7);
```

This function will return the number of certificates in the PKCS7 or RFC2630 certificate set.

pkcs7 : should contain a [gnutls_pkcs7_t](#) structure

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs7_get_crt_raw ()

int	gnutls_pkcs7_get_crt_raw	(gnutls_pkcs7_t *pkcs7, int *idx, void **certificate, size_t *certificate_size);
-----	--------------------------	---

This function will return a certificate of the PKCS7 or RFC2630 certificate set.

After the last certificate has been read **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** will be returned.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

idx : contains the index of the certificate to extract

certificate : the contents of the certificate will be copied there (may be null)

certificate_size : should hold the size of the certificate

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value. If the provided buffer is not long enough, then `certificate_size` is updated and **GNUTLS_E_SHORT_MEMORY_BUFFER** is returned.

gnutls_pkcs7_set_crt_raw ()

int	gnutls_pkcs7_set_crt_raw	(gnutls_pkcs7_t *pkcs7, const gnutls_datum_t *crt);
-----	--------------------------	--

This function will add a certificate to the PKCS7 or RFC2630 certificate set.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

crt : the DER encoded certificate to be added

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs7_set_crt ()

int	gnutls_pkcs7_set_crt	(gnutls_pkcs7_t *pkcs7, gnutls_x509_crt_t *crt);
-----	----------------------	---

This function will add a parsed certificate to the PKCS7 or RFC2630 certificate set. This is a wrapper function over `gnutls_pkcs7_set_crt()`.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

crt : the certificate to be copied.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs7_delete_crt ()

int	gnutls_pkcs7_delete_crt	(gnutls_pkcs7_t *pkcs7, int *idx);
-----	-------------------------	---------------------------------------

This function will delete a certificate from a PKCS7 or RFC2630 certificate set. Index starts from 0. Returns 0 on success.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

idx : the index of the certificate to delete

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs7_get_crl_raw ()

int	gnutls_pkcs7_get_crl_raw	(gnutls_pkcs7_t <i>pkcs7</i> ,
		int <i>indx</i> ,
		void * <i>crl</i> ,
		size_t * <i>crl_size</i>);

This function will return a crl of the PKCS7 or RFC2630 crl set.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

indx : contains the index of the crl to extract

crl : the contents of the crl will be copied there (may be null)

crl_size : should hold the size of the crl

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value. If the provided buffer is not long enough, then *crl_size* is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` is returned. After the last crl has been read `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

gnutls_pkcs7_get_crl_count ()

int	gnutls_pkcs7_get_crl_count	(gnutls_pkcs7_t <i>pkcs7</i>);
-----	----------------------------	---------------------------------

This function will return the number of certificates in the PKCS7 or RFC2630 crl set.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs7_set_crl_raw ()

int	gnutls_pkcs7_set_crl_raw	(gnutls_pkcs7_t <i>pkcs7</i> ,
		const gnutls_datum_t * <i>crl</i>);

This function will add a crl to the PKCS7 or RFC2630 crl set.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

crl : the DER encoded crl to be added

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs7_set_crl ()

int	gnutls_pkcs7_set_crl	(gnutls_pkcs7_t <i>pkcs7</i> ,
		gnutls_x509_crl_t <i>crl</i>);

This function will add a parsed CRL to the PKCS7 or RFC2630 crl set.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

crl : the DER encoded crl to be added

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs7_delete_crl ()

```
int gnutls_pkcs7_delete_crl (gnutls_pkcs7_t pkcs7,
                           int indx);
```

This function will delete a crl from a PKCS7 or RFC2630 crl set. Index starts from 0. Returns 0 on success.

pkcs7 : should contain a `gnutls_pkcs7_t` structure

indx : the index of the crl to delete

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

enum gnutls_certificate_verify_flags

```
typedef enum gnutls_certificate_verify_flags
{
    GNUTLS_VERIFY_DISABLE_CA_SIGN = 1,
    GNUTLS_VERIFY_ALLOW_X509_V1_CA_CRT = 2,
    GNUTLS_VERIFY_DO_NOT_ALLOW_SAME = 4,
    GNUTLS_VERIFY_ALLOW_ANY_X509_V1_CA_CRT = 8,
    GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD2 = 16,
    GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5 = 32,
    GNUTLS_VERIFY_DISABLE_TIME_CHECKS = 64,
    GNUTLS_VERIFY_DISABLE_TRUSTED_TIME_CHECKS = 128,
    GNUTLS_VERIFY_DO_NOT_ALLOW_X509_V1_CA_CRT = 256
} gnutls_certificate_verify_flags;
```

Enumeration of different certificate verify flags.

GNUTLS_VERIFY_DISABLE_CA_SIGN If set a signer does not have to be a certificate authority. This flag should normally be disabled, unless you know what this means.

GNUTLS_VERIFY_ALLOW_X509_V1_CA_CRT Allow only trusted CA certificates that have version 1. This is the default.

GNUTLS_VERIFY_DO_NOT_ALLOW_SAME If a certificate is not signed by anyone trusted but exists in the trusted CA list do not treat it as trusted.

GNUTLS_VERIFY_ALLOW_ANY_X509_V1_CA_CRT Allow CA certificates that have version 1 (both root and intermediate). This might be dangerous since those haven't the basicConstraints extension. Must be used in combination with **GNUTLS_VERIFY_ALLOW_X509_V1_CA_CRT**.

GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD2 Allow certificates to be signed using the broken MD2 algorithm.

GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5 Allow certificates to be signed using the broken MD5 algorithm.

GNUTLS_VERIFY_DISABLE_TIME_CHECKS Disable checking of activation and expiration validity periods of certificate chains. Don't set this unless you understand the security implications.

GNUTLS_VERIFY_DISABLE_TRUSTED_TIME_CHECKS If set a signer in the trusted list is never checked for expiration or activation.

GNUTLS_VERIFY_DO_NOT_ALLOW_X509_V1_CA_CRT Do not allow trusted CA certificates that have version 1. This option is to be used to deprecate all V1 certificates.

gnutls_x509_crt_check_issuer ()

```
int gnutls_x509_crt_check_issuer (gnutls_x509_crt_t cert,  
                                 gnutls_x509_crt_t issuer);
```

This function will check if the given certificate was issued by the given issuer.

cert : is the certificate to be checked

issuer : is the certificate of a possible issuer

Returns : It will return true (1) if the given certificate is issued by the given issuer, and false (0) if not. A negative value is returned in case of an error.

gnutls_x509_crt_list_verify ()

```
int gnutls_x509_crt_list_verify (const gnutls_x509_crt_t *cert_list ↳  
                                ,  
                                int cert_list_length,  
                                const gnutls_x509_crt_t *CA_list,  
                                int CA_list_length,  
                                const gnutls_x509_crl_t *CRL_list,  
                                int CRL_list_length,  
                                unsigned int flags,  
                                unsigned int *verify);
```

This function will try to verify the given certificate list and return its status. If no flags are specified (0), this function will use the basicConstraints (2.5.29.19) PKIX extension. This means that only a certificate authority is allowed to sign a certificate.

You must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

The certificate verification output will be put in *verify* and will be one or more of the `gnutls_certificate_status_t` enumerated elements bitwise or'd. For a more detailed verification status use [gnutls_x509_crt_verify\(\)](#) per list element.

`GNUTLS_CERT_INVALID`: the certificate chain is not valid.

`GNUTLS_CERT_REVOKED`: a certificate in the chain has been revoked.

cert_list : is the certificate list to be verified

cert_list_length : holds the number of certificate in *cert_list*

CA_list : is the CA list which will be used in verification

CA_list_length : holds the number of CA certificate in *CA_list*

CRL_list : holds a list of CRLs.

CRL_list_length : the length of CRL list.

flags : Flags that may be used to change the verification algorithm. Use OR of the `gnutls_certificate_verify_flags` enumerations.

verify : will hold the certificate verification output.

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crt_verify ()

```
int gnutls_x509_crt_verify (gnutls_x509_crt_t cert,
                           const gnutls_x509_crt_t *CA_list,
                           int CA_list_length,
                           unsigned int flags,
                           unsigned int *verify);
```

This function will try to verify the given certificate and return its status.

cert : is the certificate to be verified

CA_list : is one certificate that is considered to be trusted one

CA_list_length : holds the number of CA certificate in CA_list

flags : Flags that may be used to change the verification algorithm. Use OR of the gnutls_certificate_verify_flags enumerations.

verify : will hold the certificate verification output.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crl_verify ()

```
int gnutls_x509_crl_verify (gnutls_x509_crl_t crl,
                           const gnutls_x509_crt_t *CA_list,
                           int CA_list_length,
                           unsigned int flags,
                           unsigned int *verify);
```

This function will try to verify the given crl and return its status. See [gnutls_x509_crt_list_verify\(\)](#) for a detailed description of return values.

crl : is the crl to be verified

CA_list : is a certificate list that is considered to be trusted one

CA_list_length : holds the number of CA certificates in CA_list

flags : Flags that may be used to change the verification algorithm. Use OR of the gnutls_certificate_verify_flags enumerations.

verify : will hold the crl verification output.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_check_revocation ()

```
int gnutls_x509_crt_check_revocation (gnutls_x509_crt_t cert,
                                      const gnutls_x509_crl_t *crl_list,
                                      int crl_list_length);
```

This function will return check if the given certificate is revoked. It is assumed that the CRLs have been verified before.

cert : should contain a [gnutls_x509_crt_t](#) structure

crl_list : should contain a list of [gnutls_x509_crl_t](#) structures

crl_list_length : the length of the crl_list

Returns : 0 if the certificate is NOT revoked, and 1 if it is. A negative value is returned on error.

gnutls_x509_crt_get_fingerprint ()

```
int gnutls_x509_crt_get_fingerprint (gnutls_x509_crt_t cert,
                                     gnutls_digest_algorithm_t algo,
                                     void *buf,
                                     size_t *sizeof_buf);
```

This function will calculate and copy the certificate's fingerprint in the provided buffer.

If the buffer is null then only the size will be filled.

cert : should contain a `gnutls_x509_crt_t` structure

algo : is a digest algorithm

buf : a pointer to a structure to hold the fingerprint (may be null)

sizeof_buf : initially holds the size of **buf**

Returns : `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

gnutls_x509_crt_get_key_purpose_oid ()

```
int gnutls_x509_crt_get_key_purpose_oid (gnutls_x509_crt_t cert,
                                         int indx,
                                         void *oid,
                                         size_t *sizeof_oid,
                                         unsigned int *critical);
```

This function will extract the key purpose OIDs of the Certificate specified by the given index. These are stored in the Extended Key Usage extension (2.5.29.37) See the `GNUTLS_KP_*` definitions for human readable names.

If **oid** is null then only the size will be filled.

cert : should contain a `gnutls_x509_crt_t` structure

indx : This specifies which OID to return. Use zero to get the first one.

oid : a pointer to a buffer to hold the OID (may be null)

sizeof_oid : initially holds the size of **oid**

critical : output flag to indicate criticality of extension

Returns : `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_oid` will be updated with the required size. On success 0 is returned.

gnutls_x509_crt_set_key_purpose_oid ()

```
int gnutls_x509_crt_set_key_purpose_oid (gnutls_x509_crt_t cert,
                                         const void *oid,
                                         unsigned int critical);
```

This function will set the key purpose OIDs of the Certificate. These are stored in the Extended Key Usage extension (2.5.29.37) See the `GNUTLS_KP_*` definitions for human readable names.

Subsequent calls to this function will append OIDs to the OID list.

cert : a certificate of type `gnutls_x509_crt_t`

oid : a pointer to a null terminated string that holds the OID

critical : Whether this extension will be critical or not

Returns : On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

enum gnutls_pkcs_encrypt_flags_t

```
typedef enum gnutls_pkcs_encrypt_flags_t
{
    GNUTLS_PKCS_PLAIN = 1,
    GNUTLS_PKCS8_PLAIN = GNUTLS_PKCS_PLAIN,
    GNUTLS_PKCS_USE_PKCS12_3DES = 2,
    GNUTLS_PKCS8_USE_PKCS12_3DES = GNUTLS_PKCS_USE_PKCS12_3DES,
    GNUTLS_PKCS_USE_PKCS12_ARCFOUR = 4,
    GNUTLS_PKCS8_USE_PKCS12_ARCFOUR = GNUTLS_PKCS_USE_PKCS12_ARCFOUR,
    GNUTLS_PKCS_USE_PKCS12_RC2_40 = 8,
    GNUTLS_PKCS8_USE_PKCS12_RC2_40 = GNUTLS_PKCS_USE_PKCS12_RC2_40,
    GNUTLS_PKCS_USE_PBES2_3DES = 16,
    GNUTLS_PKCS_USE_PBES2_AES_128 = 32,
    GNUTLS_PKCS_USE_PBES2_AES_192 = 64,
    GNUTLS_PKCS_USE_PBES2_AES_256 = 128
} gnutls_pkcs_encrypt_flags_t;
```

Enumeration of different PKCS encryption flags.

GNUTLS_PKCS_PLAIN Unencrypted private key.

GNUTLS_PKCS8_PLAIN Same as **GNUTLS_PKCS_PLAIN**.

GNUTLS_PKCS_USE_PKCS12_3DES PKCS-12 3DES.

GNUTLS_PKCS8_USE_PKCS12_3DES Same as **GNUTLS_PKCS_USE_PKCS12_3DES**.

GNUTLS_PKCS_USE_PKCS12_ARCFOUR PKCS-12 ARCFOUR.

GNUTLS_PKCS8_USE_PKCS12_ARCFOUR Same as **GNUTLS_PKCS_USE_PKCS12_ARCFOUR**.

GNUTLS_PKCS_USE_PKCS12_RC2_40 PKCS-12 RC2-40.

GNUTLS_PKCS8_USE_PKCS12_RC2_40 Same as **GNUTLS_PKCS_USE_PKCS12_RC2_40**.

GNUTLS_PKCS_USE_PBES2_3DES PBES2 3DES.

GNUTLS_PKCS_USE_PBES2_AES_128 PBES2 AES-128.

GNUTLS_PKCS_USE_PBES2_AES_192 PBES2 AES-192.

GNUTLS_PKCS_USE_PBES2_AES_256 PBES2 AES-256.

gnutls_x509_privkey_init ()

int	gnutls_x509_privkey_init	(gnutls_x509_privkey_t *key);
-----	--------------------------	-------------------------------

This function will initialize an private key structure.

key : The structure to be initialized

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_deinit ()

void	gnutls_x509_privkey_deinit	(gnutls_x509_privkey_t key);
------	----------------------------	------------------------------

This function will deinitialize a private key structure.

key : The structure to be deinitialized

gnutls_x509_privkey_sec_param ()

```
int gnutls_x509_privkey_sec_param (gnutls_x509_privkey_t key);
```

This function will return the security parameter appropriate with this private key.

key : a key structure

Returns : On success, a valid security parameter is returned otherwise **GNUTLS_SEC_PARAM_UNKNOWN** is returned.

gnutls_x509_privkey_cpy ()

```
int gnutls_x509_privkey_cpy (gnutls_x509_privkey_t dst,
                            gnutls_x509_privkey_t src);
```

This function will copy a private key from source to destination key. Destination has to be initialized.

dst : The destination key, which should be initialized.

src : The source key

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_import ()

```
int gnutls_x509_privkey_import (gnutls_x509_privkey_t key,
                               const gnutls_datum_t *data,
                               gnutls_x509_crt_fmt_t format);
```

This function will convert the given DER or PEM encoded key to the native **gnutls_x509_privkey_t** format. The output will be stored in **key**.

If the key is PEM encoded it should have a header of "RSA PRIVATE KEY", or "DSA PRIVATE KEY".

key : The structure to store the parsed key

data : The DER or PEM encoded certificate.

format : One of DER or PEM

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_import_pkcs8 ()

```
int gnutls_x509_privkey_import_pkcs8 (gnutls_x509_privkey_t key,
                                      const gnutls_datum_t *data,
                                      gnutls_x509_crt_fmt_t format,
                                      const char *password,
                                      unsigned int flags);
```

This function will convert the given DER or PEM encoded PKCS8 2.0 encrypted key to the native **gnutls_x509_privkey_t** format. The output will be stored in **key**. Both RSA and DSA keys can be imported, and flags can only be used to indicate an unencrypted key.

The **password** can be either ASCII or UTF-8 in the default PBES2 encryption schemas, or ASCII for the PKCS12 schemas.

If the Certificate is PEM encoded it should have a header of "ENCRYPTED PRIVATE KEY", or "PRIVATE KEY". You only need to specify the flags if the key is DER encoded, since in that case the encryption status cannot be auto-detected.

key : The structure to store the parsed key

data : The DER or PEM encoded key.

format : One of DER or PEM

password : the password to decrypt the key (if it is encrypted).

flags : 0 if encrypted or GNUTLS_PKCS_PLAIN if not encrypted.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_import_rsa_raw ()

```
int gnutls_x509_privkey_import_rsa_raw (gnutls_x509_privkey_t *key,
                                       const gnutls_datum_t *m,
                                       const gnutls_datum_t *e,
                                       const gnutls_datum_t *d,
                                       const gnutls_datum_t *p,
                                       const gnutls_datum_t *q,
                                       const gnutls_datum_t *u);
```

This function will convert the given RSA raw parameters to the native **gnutls_x509_privkey_t** format. The output will be stored in **key**.

key : The structure to store the parsed key

m : holds the modulus

e : holds the public exponent

d : holds the private exponent

p : holds the first prime (p)

q : holds the second prime (q)

u : holds the coefficient

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_import_rsa_raw2 ()

```
int gnutls_x509_privkey_import_rsa_raw2 (gnutls_x509_privkey_t *key,
                                         const gnutls_datum_t *m,
                                         const gnutls_datum_t *e,
                                         const gnutls_datum_t *d,
                                         const gnutls_datum_t *p,
                                         const gnutls_datum_t *q,
                                         const gnutls_datum_t *u,
                                         const gnutls_datum_t *exp1,
                                         const gnutls_datum_t *exp2);
```

This function will convert the given RSA raw parameters to the native **gnutls_x509_privkey_t** format. The output will be stored in **key**.

key : The structure to store the parsed key

m : holds the modulus

e : holds the public exponent

d: holds the private exponent

p: holds the first prime (p)

q: holds the second prime (q)

u: holds the coefficient

exp1:

exp2:

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_fix ()

```
int gnutls_x509_privkey_fix(gnutls_x509_privkey_t key);
```

This function will recalculate the secondary parameters in a key. In RSA keys, this can be the coefficient and exponent1,2.

key : Holds the key

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_export_dsa_raw ()

This function will export the DSA private key's parameters found in the given structure. The new parameters will be allocated using `gnutls_malloc()` and will be stored in the appropriate datum.

key : a structure that holds the DSA parameters

p: will hold the p

q: will hold the q

g: will hold the g

y: will hold the y

x : will hold the x

Returns : On success

```
    const gnutls_datum_t *p,  
    const gnutls_datum_t *q,  
    const gnutls_datum_t *g,  
    const gnutls_datum_t *y,  
    const gnutls_datum_t *x);
```

This function will convert the given DSA raw parameters to the native `gnutls_x509_privkey_t` format. The output will be stored in `key`.

key : The structure to store the parsed key

p : holds the p

q : holds the q

g : holds the g

y : holds the y

x : holds the x

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

`gnutls_x509_privkey_get_pk_algorithm ()`

```
int gnutls_x509_privkey_get_pk_algorithm (gnutls_x509_privkey_t key);
```

This function will return the public key algorithm of a private key.

key : should contain a `gnutls_x509_privkey_t` structure

Returns : a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

`gnutls_x509_privkey_get_key_id ()`

```
int gnutls_x509_privkey_get_key_id (gnutls_x509_privkey_t key,
                                    unsigned int flags,
                                    unsigned char *output_data,
                                    size_t *output_data_size);
```

This function will return a unique ID the depends on the public key parameters. This ID can be used in checking whether a certificate corresponds to the given key.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and `GNUTLS_E_SHORT_MEMORY` will be returned. The output will normally be a SHA-1 hash output, which is 20 bytes.

key : Holds the key

flags : should be 0 for now

output_data : will contain the key ID

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_privkey_generate ()

```
int gnutls_x509_privkey_generate (gnutls_x509_privkey_t key,
                                 gnutls_pk_algorithm_t algo,
                                 unsigned int bits,
                                 unsigned int flags);
```

This function will generate a random private key. Note that this function must be called on an empty private key.

Do not set the number of bits directly, use [gnutls_sec_param_to_pk_bits\(\)](#).

key : should contain a [gnutls_x509_privkey_t](#) structure

algo : is one of RSA or DSA.

bits : the size of the modulus

flags : unused for now. Must be 0.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_privkey_export ()

```
int gnutls_x509_privkey_export (gnutls_x509_privkey_t key,
                               gnutls_x509_crt_fmt_t format,
                               void *output_data,
                               size_t *output_data_size);
```

This function will export the private key to a PKCS1 structure for RSA keys, or an integer sequence for DSA keys. The DSA keys are in the same format with the parameters used by openssl.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and [GNUTLS_E_SHORT_MEMORY_BUFFER](#) will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN RSA PRIVATE KEY".

key : Holds the key

format : the format of output params. One of PEM or DER.

output_data : will contain a private key PEM or DER encoded

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_privkey_export_pkcs8 ()

```
int gnutls_x509_privkey_export_pkcs8 (gnutls_x509_privkey_t key,
                                      gnutls_x509_crt_fmt_t format,
                                      const char *password,
                                      unsigned int flags,
                                      void *output_data,
                                      size_t *output_data_size);
```

This function will export the private key to a PKCS8 structure. Both RSA and DSA keys can be exported. For DSA keys we use PKCS 11 definitions. If the flags do not specify the encryption cipher, then the default 3DES (PBES2) will be used.

The `password` can be either ASCII or UTF-8 in the default PBES2 encryption schemas, or ASCII for the PKCS12 schemas.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and [GNUTLS_E_SHORT_MEMORY_BUFFER](#) will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN ENCRYPTED PRIVATE KEY" or "BEGIN PRIVATE KEY" if encryption is not used.

key : Holds the key

format : the format of output params. One of PEM or DER.

password : the password that will be used to encrypt the key.

flags : an ORed sequence of gnutls_pkcs_encrypt_flags_t

output_data : will contain a private key PEM or DER encoded

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_x509_privkey_export_rsa_raw2 ()

```
int gnutls_x509_privkey_export_rsa_raw2 (gnutls_x509_privkey_t key,
                                         gnutls_datum_t *m,
                                         gnutls_datum_t *e,
                                         gnutls_datum_t *d,
                                         gnutls_datum_t *p,
                                         gnutls_datum_t *q,
                                         gnutls_datum_t *u,
                                         gnutls_datum_t *e1,
                                         gnutls_datum_t *e2);
```

This function will export the RSA private key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

key : a structure that holds the rsa parameters

m : will hold the modulus

e : will hold the public exponent

d : will hold the private exponent

p : will hold the first prime (p)

q : will hold the second prime (q)

u : will hold the coefficient

e1 : will hold the exponent 1

e2 : will hold the exponent 2

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_privkey_export_rsa_raw ()

```
int gnutls_x509_privkey_export_rsa_raw (gnutls_x509_privkey_t key,
                                         gnutls_datum_t *m,
                                         gnutls_datum_t *e,
                                         gnutls_datum_t *d,
                                         gnutls_datum_t *p,
                                         gnutls_datum_t *q,
                                         gnutls_datum_t *u);
```

This function will export the RSA private key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

key : a structure that holds the rsa parameters

m : will hold the modulus

e : will hold the public exponent

d : will hold the private exponent

p : will hold the first prime (p)

q : will hold the second prime (q)

u : will hold the coefficient

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_sign_data ()

int	gnutls_x509_privkey_sign_data	(gnutls_x509_privkey_t key, gnutls_digest_algorithm_t digest, unsigned int flags, const gnutls_datum_t *data, void *signature, size_t *signature_size);
-----	--------------------------------------	--

This function will sign the given data using a signature algorithm supported by the private key. Signature algorithms are always used together with a hash functions. Different hash functions may be used for the RSA algorithm, but only SHA-1 for the DSA keys.

If the buffer provided is not long enough to hold the output, then **signature_size* is updated and **GNUTLS_E_SHORT_MEMORY_BUFFER** will be returned.

Use [gnutls_x509_crt_get_preferred_hash_algorithm\(\)](#) to determine the hash algorithm.

key : Holds the key

digest : should be MD5 or SHA1

flags : should be 0 for now

data : holds the data to be signed

signature : will contain the signature

signature_size : holds the size of signature (and will be replaced by the new size)

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_privkey_sign_data2 ()

int	gnutls_x509_privkey_sign_data2	(gnutls_x509_privkey_t key, gnutls_digest_algorithm_t digest, unsigned int flags, const gnutls_datum_t *data, gnutls_datum_t *signature);
-----	---------------------------------------	---

This function will sign the given data using a signature algorithm supported by the private key. Signature algorithms are always used together with a hash functions. Different hash functions may be used for the RSA algorithm, but only SHA-1 for the DSA keys.

If the buffer provided is not long enough to hold the output, then **signature_size* is updated and **GNUTLS_E_SHORT_MEMORY_BUFFER** will be returned.

Use [gnutls_x509_crt_get_preferred_hash_algorithm\(\)](#) to determine the hash algorithm.

key :**digest :** should be MD5 or SHA1**flags :** should be 0 for now**data :** holds the data to be signed**signature :** will contain the signature allocate with [gnutls_malloc\(\)](#)**Returns :** On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.**[gnutls_x509_privkey_verify_data \(\)](#)**

```
int gnutls_x509_privkey_verify_data (gnutls_x509_privkey_t key,
                                    unsigned int flags,
                                    const gnutls_datum_t *data,
                                    const gnutls_datum_t *signature);
```

This function will verify the given signed data, using the parameters in the private key.

key : Holds the key**flags :** should be 0 for now**data :** holds the data to be signed**signature :** contains the signature**Returns :** In case of a verification failure 0 is returned, and 1 on success.**[gnutls_x509_crt_verify_data \(\)](#)**

```
int gnutls_x509_crt_verify_data (gnutls_x509_crt_t crt,
                                 unsigned int flags,
                                 const gnutls_datum_t *data,
                                 const gnutls_datum_t *signature);
```

This function will verify the given signed data, using the parameters from the certificate.

crt : Holds the certificate**flags :** should be 0 for now**data :** holds the data to be signed**signature :** contains the signature**Returns :** In case of a verification failure 0 is returned, and 1 on success.**[gnutls_x509_crt_verify_hash \(\)](#)**

```
int gnutls_x509_crt_verify_hash (gnutls_x509_crt_t crt,
                                unsigned int flags,
                                const gnutls_datum_t *hash,
                                const gnutls_datum_t *signature);
```

This function will verify the given signed digest, using the parameters from the certificate.

crt : Holds the certificate

flags : should be 0 for now

hash : holds the hash digest to be verified

signature : contains the signature

Returns : In case of a verification failure 0 is returned, and 1 on success.

gnutls_x509_crt_get_verify_algorithm ()

```
int gnutls_x509_crt_get_verify_algorithm
(gnutls_x509_crt_t crt,
 const gnutls_datum_t *signature,
 gnutls_digest_algorithm_t *hash);
```

This function will read the certificate and the signed data to determine the hash algorithm used to generate the signature.

crt : Holds the certificate

signature : contains the signature

hash : The result of the call with the hash algorithm used for signature

Returns : the 0 if the hash algorithm is found. A negative value is returned on error.

Since 2.8.0

gnutls_x509_privkey_sign_hash ()

```
int gnutls_x509_privkey_sign_hash
(gnutls_x509_privkey_t key,
 const gnutls_datum_t *hash,
 gnutls_datum_t *signature);
```

This function will sign the given hash using the private key. Do not use this function directly unless you know what it is. Typical signing requires the data to be hashed and stored in special formats (e.g. BER Digest-Info for RSA).

key : Holds the key

hash : holds the data to be signed

signature : will contain newly allocated signature

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

struct gnutls_x509_crq_int

```
struct gnutls_x509_crq_int;
```

gnutls_x509_crq_t

```
typedef struct gnutls_x509_crq_int *gnutls_x509_crq_t;
```

gnutls_x509_crq_print ()

```
int gnutls_x509_crq_print (gnutls_x509_crq_t crq,
                           gnutls_certificate_print_formats_t ←
                           format,
                           gnutls_datum_t *out);
```

This function will pretty print a certificate request, suitable for display to a human.

The output *out* needs to be deallocate using [gnutls_free\(\)](#).

crq : The structure to be printed

format : Indicate the format to use

out : Newly allocated datum with zero terminated string.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

Since 2.8.0

gnutls_x509_crq_init ()

```
int gnutls_x509_crq_init (gnutls_x509_crq_t *crq);
```

This function will initialize a PKCS10 certificate request structure.

crq : The structure to be initialized

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crq_deinit ()

```
void gnutls_x509_crq_deinit (gnutls_x509_crq_t crq);
```

This function will deinitialize a PKCS10 certificate request structure.

crq : The structure to be initialized

gnutls_x509_crq_import ()

```
int gnutls_x509_crq_import (gnutls_x509_crq_t crq,
                           const gnutls_datum_t *data,
                           gnutls_x509_crt_fmt_t format);
```

This function will convert the given DER or PEM encoded certificate request to a [gnutls_x509_crq_t](#) structure. The output will be stored in *crq*.

If the Certificate is PEM encoded it should have a header of "NEW CERTIFICATE REQUEST".

crq : The structure to store the parsed certificate request.

data : The DER or PEM encoded certificate.

format : One of DER or PEM

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crq_get_preferred_hash_algorithm ()

```
int gnutls_x509_crq_get_preferred_hash_algorithm
(gnutls_x509_crq_t crq,
 gnutls_digest_algorithm_t *hash,
 unsigned int *mand);
```

This function will read the certificate and return the appropriate digest algorithm to use for signing with this certificate. Some certificates (i.e. DSA might not be able to sign without the preferred algorithm).

crq : Holds the certificate

hash : The result of the call with the hash algorithm used for signature

mand : If non zero it means that the algorithm MUST use this hash. May be NULL.

Returns : the 0 if the hash algorithm is found. A negative value is returned on error.

Since 2.11.0

gnutls_x509_crq_get_dn ()

```
int gnutls_x509_crq_get_dn
(gnutls_x509_crq_t crq,
 char *buf,
 size_t *sizeof_buf);
```

This function will copy the name of the Certificate request subject to the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC 2253. The output string *buf* will be ASCII or UTF-8 encoded, depending on the certificate data.

crq : should contain a `gnutls_x509_crq_t` structure

buf : a pointer to a structure to hold the name (may be **NULL**)

sizeof_buf : initially holds the size of *buf*

Returns : **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the **sizeof_buf* will be updated with the required size. On success 0 is returned.

gnutls_x509_crq_get_dn_oid ()

```
int gnutls_x509_crq_get_dn_oid
(gnutls_x509_crq_t crq,
 int indx,
 void *oid,
 size_t *sizeof_oid);
```

This function will extract the requested OID of the name of the certificate request subject, specified by the given index.

crq : should contain a `gnutls_x509_crq_t` structure

indx : Specifies which DN OID to send. Use zero to get the first one.

oid : a pointer to a structure to hold the name (may be **NULL**)

sizeof_oid : initially holds the size of *oid*

Returns : **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the **sizeof_oid* will be updated with the required size. On success 0 is returned.

gnutls_x509_crq_get_dn_by_oid ()

int	gnutls_x509_crq_get_dn_by_oid	(gnutls_x509_crq_t crq, const char *oid, int indx, unsigned int raw_flag, void *buf, size_t *sizeof_buf);
-----	-------------------------------	--

This function will extract the part of the name of the Certificate request subject, specified by the given OID. The output will be encoded as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

Some helper macros with popular OIDs can be found in gnutls/x509.h If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 -- in hex format with a '#' prefix. You can check about known OIDs using [gnutls_x509_dn_oid_known\(\)](#).

crq : should contain a `gnutls_x509_crq_t` structure

oid : holds an Object Identified in null terminated string

indx : In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

raw_flag : If non zero returns the raw DER data of the DN part.

buf : a pointer to a structure to hold the name (may be **NULL**)

sizeof_buf : initially holds the size of `buf`

Returns : **GNUTLS_E_SHORT_MEMORY_BUFFER** if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

gnutls_x509_crq_set_dn_by_oid ()

int	gnutls_x509_crq_set_dn_by_oid	(gnutls_x509_crq_t crq, const char *oid, unsigned int raw_flag, const void *data, unsigned int sizeof_data);
-----	-------------------------------	--

This function will set the part of the name of the Certificate request subject, specified by the given OID. The input string should be ASCII or UTF-8 encoded.

Some helper macros with popular OIDs can be found in gnutls/x509.h With this function you can only set the known OIDs. You can test for known OIDs using [gnutls_x509_dn_oid_known\(\)](#). For OIDs that are not known (by gnutls) you should properly DER encode your data, and call this function with raw_flag set.

crq : should contain a `gnutls_x509_crq_t` structure

oid : holds an Object Identifier in a zero-terminated string

raw_flag : must be 0, or 1 if the data are DER encoded

data : a pointer to the input data

sizeof_data : holds the size of `data`

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crq_set_version ()

```
int gnutls_x509_crq_set_version (gnutls_x509_crq_t crq,
                                unsigned int version);
```

This function will set the version of the certificate request. For version 1 requests this must be one.

crq : should contain a `gnutls_x509_crq_t` structure

version : holds the version number, for v1 Requests must be 1

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crq_get_version ()

```
int gnutls_x509_crq_get_version (gnutls_x509_crq_t crq);
```

This function will return the version of the specified Certificate request.

crq : should contain a `gnutls_x509_crq_t` structure

Returns : version of certificate request, or a negative value on error.

gnutls_x509_crq_set_key ()

```
int gnutls_x509_crq_set_key (gnutls_x509_crq_t crq,
                            gnutls_x509_privkey_t key);
```

This function will set the public parameters from the given private key to the request. Only RSA keys are currently supported.

crq : should contain a `gnutls_x509_crq_t` structure

key : holds a private key

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crq_sign2 ()

```
int gnutls_x509_crq_sign2 (gnutls_x509_crq_t crq,
                           gnutls_x509_privkey_t key,
                           gnutls_digest_algorithm_t dig,
                           unsigned int flags);
```

This function will sign the certificate request with a private key. This must be the same key as the one used in `gnutls_x509_crt_set_key()` since a certificate request is self signed.

This must be the last step in a certificate request generation since all the previously set parameters are now signed.

Use `gnutls_x509_crq_get_preferred_hash_algorithm()` to obtain the digest algorithm to use with the specified public key algorithm.

crq : should contain a `gnutls_x509_crq_t` structure

key : holds a private key

dig : The message digest to use, i.e., `GNUTLS_DIG_SHA1`

flags : must be 0

Returns : `GNUTLS_E_SUCCESS` on success, otherwise an error. `GNUTLS_E ASN1_VALUE_NOT_FOUND` is returned if you didn't set all information in the certificate request (e.g., the version using `gnutls_x509_crq_set_version()`).

gnutls_x509_crq_sign ()

```
int gnutls_x509_crq_sign (gnutls_x509_crq_t crq,
                           gnutls_x509_privkey_t key);
```

This function is the same a [gnutls_x509_crq_sign2\(\)](#) with no flags, and SHA1 as the hash algorithm.

crq : should contain a [gnutls_x509_crq_t](#) structure

key : holds a private key

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crq_set_challenge_password ()

```
int gnutls_x509_crq_set_challenge_password (gnutls_x509_crq_t crq,
                                             const char *pass);
```

This function will set a challenge password to be used when revoking the request.

crq : should contain a [gnutls_x509_crq_t](#) structure

pass : holds a zero-terminated password

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crq_get_challenge_password ()

```
int gnutls_x509_crq_get_challenge_password (gnutls_x509_crq_t crq,
                                             char *pass,
                                             size_t *sizeof_pass);
```

This function will return the challenge password in the request. The challenge password is intended to be used for requesting a revocation of the certificate.

crq : should contain a [gnutls_x509_crq_t](#) structure

pass : will hold a zero-terminated password string

sizeof_pass : Initially holds the size of **pass**.

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crq_set_attribute_by_oid ()

```
int gnutls_x509_crq_set_attribute_by_oid (gnutls_x509_crq_t crq,
                                         const char *oid,
                                         void *buf,
                                         size_t sizeof_buf);
```

This function will set the attribute in the certificate request specified by the given Object ID. The attribute must be be DER encoded.

crq : should contain a [gnutls_x509_crq_t](#) structure

oid: holds an Object Identified in zero-terminated string

buf: a pointer to a structure that holds the attribute data

sizeof_buf: holds the size of *buf*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crq_get_attribute_by_oid ()

```
int gnutls_x509_crq_get_attribute_by_oid
(gnutls_x509_crq_t crq,
 const char *oid,
 int indx,
 void *buf,
 size_t *sizeof_buf);
```

This function will return the attribute in the certificate request specified by the given Object ID. The attribute will be DER encoded.

crq: should contain a [gnutls_x509_crq_t](#) structure

oid: holds an Object Identified in zero-terminated string

indx: In case multiple same OIDs exist in the attribute list, this specifies which to send, use zero to get the first one

buf: a pointer to a structure to hold the attribute data (may be **NULL**)

sizeof_buf: initially holds the size of *buf*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crq_export ()

```
int gnutls_x509_crq_export
(gnutls_x509_crq_t crq,
 gnutls_x509_crt_fmt_t format,
 void *output_data,
 size_t *output_data_size);
```

This function will export the certificate request to a PEM or DER encoded PKCS10 structure.

If the buffer provided is not long enough to hold the output, then **GNUTLS_E_SHORT_MEMORY_BUFFER** will be returned and **output_data_size* will be updated.

If the structure is PEM encoded, it will have a header of "BEGIN NEW CERTIFICATE REQUEST".

crq: should contain a [gnutls_x509_crq_t](#) structure

format: the format of output params. One of PEM or DER.

output_data: will contain a certificate request PEM or DER encoded

output_data_size: holds the size of *output_data* (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_x509_crt_set_crq ()

```
int gnutls_x509_crt_set_crq (gnutls_x509_crt_t crt,  
                           gnutls_x509_crq_t crq);
```

This function will set the name and public parameters as well as the extensions from the given certificate request to the certificate. Only RSA keys are currently supported.

crt : a certificate of type `gnutls_x509_crt_t`

crg : holds a certificate request

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_x509_crt_set_crq_extensions ()

This function will set extensions from the given request to the certificate.

crt : a certificate of type `gnutls_x509_crt_t`

crg : holds a certificate request

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.8.0

gnutls_x509_crq_set_key_rsa_raw ()

This function will set the public parameters from the given private key to the request. Only RSA keys are currently supported.

crq: should contain a gnutls_x509_crq_t structure

m : holds the modulus

e : holds the public exponent

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.6.0

gnutls_x509_crq_set_subject_alt_name()

```
int gnutls_x509_crq_set_subject_alt_name
(gnutls_x509_crq_t crq,
 gnutls_x509_subject_alt_name_t nt,
 const void *data,
 unsigned int data_size,
 unsigned int flags);
```

This function will set the subject alternative name certificate extension. It can set the following types:

&GNUTLS_SAN_DNSNAME: as a text string

&GNUTLS_SAN_RFC822NAME: as a text string

&GNUTLS_SAN_URI: as a text string

&GNUTLS_SAN_IPADDRESS: as a binary IP address (4 or 16 bytes)

Other values can be set as binary values with the proper DER encoding.

crq: a certificate request of type `gnutls_x509_crq_t`

nt: is one of the `gnutls_x509_subject_alt_name_t` enumerations

data: The data to be set

data_size: The size of data to be set

flags: `GNUTLS_FSAN_SET` to clear previous data or `GNUTLS_FSAN_APPEND` to append.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since 2.8.0

`gnutls_x509_crq_set_key_usage ()`

```
int gnutls_x509_crq_set_key_usage (gnutls_x509_crq_t crq,  
                                  unsigned int usage);
```

This function will set the keyUsage certificate extension.

crq: a certificate request of type `gnutls_x509_crq_t`

usage: an ORed sequence of the `GNUTLS_KEY_*` elements.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since 2.8.0

`gnutls_x509_crq_set_basic_constraints ()`

```
int gnutls_x509_crq_set_basic_constraints (gnutls_x509_crq_t crq,  
                                         unsigned int ca,  
                                         int pathLenConstraint);
```

This function will set the basicConstraints certificate extension.

crq: a certificate request of type `gnutls_x509_crq_t`

ca: true(1) or false(0) depending on the Certificate authority status.

pathLenConstraint: non-negative values indicate maximum length of path, and negative values indicate that the pathLenConstraints field should not be present.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since 2.8.0

gnutls_x509_crq_set_key_purpose_oid ()

```
int gnutls_x509_crq_set_key_purpose_oid (gnutls_x509_crq_t crq,
                                         const void *oid,
                                         unsigned int critical);
```

This function will set the key purpose OIDs of the Certificate. These are stored in the Extended Key Usage extension (2.5.29.37). See the GNUTLS_KP_* definitions for human readable names.

Subsequent calls to this function will append OIDs to the OID list.

crq: a certificate of type [gnutls_x509_crq_t](#)

oid: a pointer to a zero-terminated string that holds the OID

critical: Whether this extension will be critical or not

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

Since 2.8.0

gnutls_x509_crq_get_key_purpose_oid ()

```
int gnutls_x509_crq_get_key_purpose_oid (gnutls_x509_crq_t crq,
                                         int indx,
                                         void *oid,
                                         size_t *sizeof_oid,
                                         unsigned int *critical);
```

This function will extract the key purpose OIDs of the Certificate specified by the given index. These are stored in the Extended Key Usage extension (2.5.29.37). See the GNUTLS_KP_* definitions for human readable names.

crq: should contain a [gnutls_x509_crq_t](#) structure

indx: This specifies which OID to return, use zero to get the first one

oid: a pointer to a buffer to hold the OID (may be [NULL](#))

sizeof_oid: initially holds the size of **oid**

critical: output variable with critical flag, may be [NULL](#).

Returns : [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if the provided buffer is not long enough, and in that case the ***sizeof_oid** will be updated with the required size. On success 0 is returned.

Since 2.8.0

gnutls_x509_crq_get_extension_data ()

```
int gnutls_x509_crq_get_extension_data (gnutls_x509_crq_t crq,
                                         int indx,
                                         void *data,
                                         size_t *sizeof_data);
```

This function will return the requested extension data in the certificate. The extension data will be stored as a string in the provided buffer.

Use [gnutls_x509_crq_get_extension_info\(\)](#) to extract the OID and critical flag. Use [gnutls_x509_crq_get_extension_by_oid\(\)](#) instead, if you want to get data indexed by the extension OID rather than sequence.

crq : should contain a `gnutls_x509_crq_t` structure

indx : Specifies which extension OID to send. Use zero to get the first one.

data : a pointer to a structure to hold the data (may be null)

sizeof_data : initially holds the size of *oid*

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If you have reached the last extension available `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since 2.8.0

`gnutls_x509_crq_get_extension_info ()`

```
int gnutls_x509_crq_get_extension_info (gnutls_x509_crq_t crq,
                                         int indx,
                                         void *oid,
                                         size_t *sizeof_oid,
                                         int *critical);
```

This function will return the requested extension OID in the certificate, and the critical flag for it. The extension OID will be stored as a string in the provided buffer. Use `gnutls_x509_crq_get_extension_data()` to extract the data.

If the buffer provided is not long enough to hold the output, then `*sizeof_oid` is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned.

crq : should contain a `gnutls_x509_crq_t` structure

indx : Specifies which extension OID to send. Use zero to get the first one.

oid : a pointer to a structure to hold the OID

sizeof_oid : initially holds the maximum size of *oid*, on return holds actual size of *oid*.

critical : output variable with critical flag, may be NULL.

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If you have reached the last extension available `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since 2.8.0

`gnutls_x509_crq_get_attribute_data ()`

```
int gnutls_x509_crq_get_attribute_data (gnutls_x509_crq_t crq,
                                         int indx,
                                         void *data,
                                         size_t *sizeof_data);
```

This function will return the requested attribute data in the certificate request. The attribute data will be stored as a string in the provided buffer.

Use `gnutls_x509_crq_get_attribute_info()` to extract the OID. Use `gnutls_x509_crq_get_attribute_by_oid()` instead, if you want to get data indexed by the attribute OID rather than sequence.

crq : should contain a `gnutls_x509_crq_t` structure

indx : Specifies which attribute OID to send. Use zero to get the first one.

data : a pointer to a structure to hold the data (may be null)

sizeof_data: initially holds the size of *oid*

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If you have reached the last extension available `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since 2.8.0

gnutls_x509_crq_get_attribute_info ()

This function will return the requested attribute OID in the certificate, and the critical flag for it. The attribute OID will be stored as a string in the provided buffer. Use `gnutls_x509_crq_get_attribute_data()` to extract the data.

If the buffer provided is not long enough to hold the output, then `*sizeof_oid` is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned.

crq: should contain a `gnutls_x509_crq_t` structure

idx: Specifies which attribute OID to send. Use zero to get the first one.

oid: a pointer to a structure to hold the OID

`sizeof_oid`: initially holds the maximum size of `oid`, on return holds actual size of `oid`.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative value in case of an error. If you have reached the last extension available **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** will be returned.

Since 2.8.0

gnutls_x509_crq_get_pk_algorithm ()

This function will return the public key algorithm of a PKCS10 certificate request.

If bits is non-**NULL**, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

crq : should contain a `gnutls_x509_crq_t` structure

bits : if bits is non-NULL it will hold the size of the parameters' in bits

Returns : a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

```
gnutls_x509_crt_get_key_id()
```

This function will return a unique ID the depends on the public key parameters. This ID can be used in checking whether a certificate corresponds to the given private key.

If the buffer provided is not long enough to hold the output, then `*output_data_size` is updated and GNUTLS_E_SHORT_MEMORY will be returned. The output will normally be a SHA-1 hash output, which is 20 bytes.

crq : a certificate of type `gnutls_x509_crq_t`

flags : should be 0 for now

output_data : will contain the key ID

output_data_size : holds the size of `output_data` (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

Since 2.8.0

`gnutls_x509_crq_get_key_rsa_raw ()`

```
int gnutls_x509_crq_get_key_rsa_raw (gnutls_x509_crq_t crq,
                                     gnutls_datum_t *m,
                                     gnutls_datum_t *e);
```

This function will export the RSA public key's parameters found in the given structure. The new parameters will be allocated using `gnutls_malloc()` and will be stored in the appropriate datum.

crq : Holds the certificate

m : will hold the modulus

e : will hold the public exponent

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since 2.8.0

`gnutls_x509_crq_get_key_usage ()`

```
int gnutls_x509_crq_get_key_usage (gnutls_x509_crq_t crq,
                                   unsigned int *key_usage,
                                   unsigned int *critical);
```

This function will return certificate's key usage, by reading the keyUsage X.509 extension (2.5.29.15). The key usage value will ORed values of the: `GNUTLS_KEY_DIGITAL_SIGNATURE`, `GNUTLS_KEY_NON_REPUDIATION`, `GNUTLS_KEY_KEY_ENCIPHERMENT`, `GNUTLS_KEY_DATA_ENCIPHERMENT`, `GNUTLS_KEY_KEY_AGREEMENT`, `GNUTLS_KEY_KEY_CERT_SIGN`, `GNUTLS_KEY_ENCIPHER_ONLY`, `GNUTLS_KEY_DECIPHER_ONLY`.

crq : should contain a `gnutls_x509_crq_t` structure

key_usage : where the key usage bits will be stored

critical : will be non zero if the extension is marked as critical

Returns : the certificate key usage, or a negative value in case of parsing error. If the certificate does not contain the keyUsage extension `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since 2.8.0

gnutls_x509_crq_get_basic_constraints ()

```
int gnutls_x509_crq_get_basic_constraints
(gnutls_x509_crq_t crq,
 unsigned int *critical,
 int *ca,
 int *pathlen);
```

This function will read the certificate's basic constraints, and return the certificates CA status. It reads the basicConstraints X.509 extension (2.5.29.19).

crq : should contain a [gnutls_x509_crq_t](#) structure

critical : will be non zero if the extension is marked as critical

ca : pointer to output integer indicating CA status, may be NULL, value is 1 if the certificate CA flag is set, 0 otherwise.

pathlen : pointer to output integer indicating path length (may be NULL), non-negative values indicate a present pathLenConstraint field and the actual value, -1 indicate that the field is absent.

Returns : If the certificate is a CA a positive value will be returned, or zero if the certificate does not have CA flag set.

A negative value may be returned in case of errors. If the certificate does not contain the basicConstraints extension

[GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

Since 2.8.0

gnutls_x509_crq_get_subject_alt_name ()

```
int gnutls_x509_crq_get_subject_alt_name
(gnutls_x509_crq_t crq,
 unsigned int seq,
 void *ret,
 size_t *ret_size,
 unsigned int *ret_type,
 unsigned int *critical);
```

This function will return the alternative names, contained in the given certificate. It is the same as [gnutls_x509_crq_get_subject_alt_name](#) except for the fact that it will return the type of the alternative name in *ret_type* even if the function fails for some reason (i.e. the buffer provided is not enough).

crq : should contain a [gnutls_x509_crq_t](#) structure

seq : specifies the sequence number of the alt name, 0 for the first one, 1 for the second etc.

ret : is the place where the alternative name will be copied to

ret_size : holds the size of ret.

ret_type : holds the [gnutls_x509_subject_alt_name_t](#) name type

critical : will be non zero if the extension is marked as critical (may be null)

Returns : the alternative subject name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). It will return [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if *ret_size* is not large enough to hold the value. In that case *ret_size* will be updated with the required size. If the certificate request does not have an Alternative name with the specified sequence number then [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) is returned.

Since 2.8.0

gnutls_x509_crq_get_subject_alt_othername_oid ()

```
int gnutls_x509_crq_get_subject_alt_othername_oid
(gnutls_x509_crq_t crq,
 unsigned int seq,
 void *ret,
 size_t *ret_size);
```

This function will extract the type OID of an otherName Subject Alternative Name, contained in the given certificate, and return the type as an enumerated element.

This function is only useful if [gnutls_x509_crq_get_subject_alt_name\(\)](#) returned [GNUTLS_SAN_OTHERNAME](#).

crq : should contain a [gnutls_x509_crq_t](#) structure

seq : specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

ret : is the place where the otherName OID will be copied to

ret_size : holds the size of ret.

Returns : the alternative subject name type on success, one of the enumerated [gnutls_x509_subject_alt_name_t](#). For supported OIDs, it will return one of the virtual ([GNUTLS_SAN_OTHERNAME_*](#)) types, e.g. [GNUTLS_SAN_OTHERNAME_XMPP](#), and [GNUTLS_SAN_OTHERNAME](#) for unknown OIDs. It will return [GNUTLS_E_SHORT_MEMORY_BUFFER](#) if *ret_size* is not large enough to hold the value. In that case *ret_size* will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number and with the otherName type then [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) is returned.

Since 2.8.0

gnutls_x509_crq_get_extension_by_oid ()

```
int gnutls_x509_crq_get_extension_by_oid
(gnutls_x509_crq_t crq,
 const char *oid,
 int indx,
 void *buf,
 size_t *sizeof_buf,
 unsigned int *critical);
```

This function will return the extension specified by the OID in the certificate. The extensions will be returned as binary data DER encoded, in the provided buffer.

crq : should contain a [gnutls_x509_crq_t](#) structure

oid : holds an Object Identified in null terminated string

indx : In case multiple same OIDs exist in the extensions, this specifies which to send. Use zero to get the first one.

buf : a pointer to a structure to hold the name (may be null)

sizeof_buf : initially holds the size of *buf*

critical : will be non zero if the extension is marked as critical

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative value in case of an error. If the certificate does not contain the specified extension [GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE](#) will be returned.

Since 2.8.0

1.4 pkcs11

```
#define GNUTLS_PKCS11_FLAG_AUTO 1 /* Automatically load libraries by reading /etc/gnutls/ ←
                                    pkcs11.conf */
```

gnutls_pkcs11_init ()

```
int gnutls_pkcs11_init (unsigned int flags,
                        const char *configfile);
```

This function will initialize the PKCS 11 subsystem in gnutls. It will read a configuration file if **GNUTLS_PKCS11_FLAG_AUTO** is used or allow you to independently load PKCS 11 modules using [gnutls_pkcs11_add_provider\(\)](#) if **GNUTLS_PKCS11_FLAG_MANUAL** is specified.

Normally you don't need to call this function since it is being called by [gnutls_global_init\(\)](#). Otherwise you must call it before it.

flags : **GNUTLS_PKCS11_FLAG_MANUAL** or **GNUTLS_PKCS11_FLAG_AUTO**

configfile : either NULL or the location of a configuration file

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_deinit ()

```
void gnutls_pkcs11_deinit (void);
```

This function will deinitialize the PKCS 11 subsystem in gnutls.

gnutls_pkcs11_set_token_function ()

```
void gnutls_pkcs11_set_token_function (gnutls_pkcs11_token_callback_t fn,
                                      void *userdata);
```

This function will set a callback function to be used when a token needs to be inserted to continue PKCS 11 operations.

fn : The PIN callback

userdata : data to be supplied to callback

gnutls_pkcs11_set_pin_function ()

```
void gnutls_pkcs11_set_pin_function (gnutls_pkcs11_pin_callback_t *fn,
                                     void *data);
```

This function will set a callback function to be used when a PIN is required for PKCS 11 operations.

Callback for PKCS11 PIN entry. The callback provides the PIN code to unlock the token with label 'token_label', specified by the URL 'token_url'.

The PIN code, as a NUL-terminated ASCII string, should be copied into the 'pin' buffer (of maximum size pin_max), and return 0 to indicate success. Alternatively, the callback may return a negative gnutls error code to indicate failure and cancel PIN entry (in which case, the contents of the 'pin' parameter are ignored).

When a PIN is required, the callback will be invoked repeatedly (and indefinitely) until either the returned PIN code is correct, the callback returns failure, or the token refuses login (e.g. when the token is locked due to too many incorrect PINs!). For the first such invocation, the 'attempt' counter will have value zero; it will increase by one for each subsequent attempt.

callback :

data :

gnutls_pkcs11_add_provider ()

```
int gnutls_pkcs11_add_provider (const char *name,
                               const char *params);
```

This function will load and add a PKCS 11 module to the module list used in gnutls. After this function is called the module will be used for PKCS 11 operations.

name : The filename of the module

params : should be NULL

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_obj_init ()

```
int gnutls_pkcs11_obj_init (gnutls_pkcs11_obj_t *certificate);
```

This function will initialize a pkcs11 certificate structure.

***certificate*:**

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

GNUTLS_PKCS11_OBJ_FLAG_LOGIN

```
#define GNUTLS_PKCS11_OBJ_FLAG_LOGIN (1<<0)/* force login in the token for the operation */
```

GNUTLS_PKCS11_OBJ_FLAG_MARK_TRUSTED

```
#define GNUTLS_PKCS11_OBJ_FLAG_MARK_TRUSTED (1<<1)/* object marked as trusted */
```

GNUTLS_PKCS11_OBJ_FLAG_MARK_SENSITIVE

```
#define GNUTLS_PKCS11_OBJ_FLAG_MARK_SENSITIVE (1<<2)/* object marked as sensitive (unexportable) */
```

enum gnutls_pkcs11_url_type_t

```
typedef enum
{
    GNUTLS_PKCS11_URL_GENERIC, /* URL specifies the object on token level */
    GNUTLS_PKCS11_URL_LIB, /* URL specifies the object on module level */
    GNUTLS_PKCS11_URL_LIB_VERSION /* URL specifies the object on module and version level */
} gnutls_pkcs11_url_type_t;
```

gnutls_pkcs11_obj_import_url ()

```
int gnutls_pkcs11_obj_import_url (gnutls_pkcs11_obj_t Param1,
                                 const char *url,
                                 unsigned int flags);
```

***Param1*:**

***url*:**

***flags*:**

Returns :

gnutls_pkcs11_obj_export_url ()

int	gnutls_pkcs11_obj_export_url	(gnutls_pkcs11_obj_t Param1, gnutls_pkcs11_url_type_t detailed, char **url);
-----	------------------------------	--

This function will export a URL identifying the given certificate.

Param1 :

detailed : non zero if a detailed URL is required

url : will contain an allocated url

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_obj_deinit ()

void	gnutls_pkcs11_obj_deinit	(gnutls_pkcs11_obj_t Param1);
------	--------------------------	-------------------------------

This function will deinitialize a certificate structure.

Param1 :

gnutls_pkcs11_obj_export ()

int	gnutls_pkcs11_obj_export	(gnutls_pkcs11_obj_t obj, void *output_data, size_t *output_data_size);
-----	--------------------------	---

This function will export the pkcs11 object data. It is normal for PKCS 11 data to be inaccessible and in that case **GNUTLS_E_INVALID_** will be returned.

If the buffer provided is not long enough to hold the output, then *output_data_size is updated and **GNUTLS_E_SHORT_MEMORY_BU** will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN CERTIFICATE".

obj :

output_data : will contain a certificate PEM or DER encoded

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_pkcs11_copy_x509_crt ()

int	gnutls_pkcs11_copy_x509_crt	(const char *token_url, gnutls_x509_crt_t crt, const char *label, unsigned int flags);
-----	-----------------------------	---

This function will copy a raw secret (symmetric) key into a PKCS 11 token specified by a URL. The key can be marked as sensitive or not.

token_url : A PKCS 11 URL specifying a token

crt :

label : A name to be used for the stored data

flags : One of GNUTLS_PKCS11_OBJ_FLAG_*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_copy_x509_privkey ()

```
int gnutls_pkcs11_copy_x509_privkey (const char *token_url,  
                                     gnutls_x509_privkey_t crt,  
                                     const char *label,  
                                     unsigned int key_usage,  
                                     unsigned int flags);
```

This function will copy a private key into a PKCS 11 token specified by a URL. It is highly recommended flags to contain **GNUTLS_PKCS11_OBJ_FLAG_MARK_SENSITIVE** unless there is a strong reason not to.

token_url : A PKCS 11 URL specifying a token

crt :

label : A name to be used for the stored data

key_usage : One of GNUTLS_KEY_*

flags : One of GNUTLS_PKCS11_OBJ_* flags

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_delete_url ()

```
int gnutls_pkcs11_delete_url (const char *object_url,  
                             unsigned int flags);
```

This function will delete objects matching the given URL.

object_url : The URL of the object to delete.

flags : One of GNUTLS_PKCS11_OBJ_* flags

Returns : On success, the number of objects deleted is returned, otherwise a negative error value.

gnutls_pkcs11_copy_secret_key ()

```
int gnutls_pkcs11_copy_secret_key (const char *token_url,  
                                   gnutls_datum_t *key,  
                                   const char *label,  
                                   unsigned int key_usage,  
                                   unsigned int flags);
```

token_url :

key :

label :

key_usage :

flags :

Returns :

enum gnutls_pkcs11_obj_info_t

```
typedef enum
{
    GNUTLS_PKCS11_OBJ_ID_HEX = 1,
    GNUTLS_PKCS11_OBJ_LABEL,
    GNUTLS_PKCS11_OBJ_TOKEN_LABEL,
    GNUTLS_PKCS11_OBJ_TOKEN_SERIAL,
    GNUTLS_PKCS11_OBJ_TOKEN_MANUFACTURER,
    GNUTLS_PKCS11_OBJ_TOKEN_MODEL,
    GNUTLS_PKCS11_OBJ_ID,
    /* the pkcs11 provider library info */
    GNUTLS_PKCS11_OBJ_LIBRARY_VERSION,
    GNUTLS_PKCS11_OBJ_LIBRARY_DESCRIPTION,
    GNUTLS_PKCS11_OBJ_LIBRARY_MANUFACTURER
} gnutls_pkcs11_obj_info_t;
```

gnutls_pkcs11_obj_get_info ()

int	gnutls_pkcs11_obj_get_info	(gnutls_pkcs11_obj_t crt,
		gnutls_pkcs11_obj_info_t itype,
		void *output,
		size_t *output_size);

This function will return information about the PKCS 11 certificates such as the label, id as well as token information where the key is stored. When output is text it returns null terminated string although **output_size** contains the size of the actual data only.

crt : should contain a **gnutls_pkcs11_obj_t** structure

itype : Denotes the type of information requested

output : where output will be stored

output_size : contains the maximum size of the output and will be overwritten with actual

Returns : zero on success or a negative value on error.

enum gnutls_pkcs11_obj_attr_t

```
typedef enum
{
    GNUTLS_PKCS11_OBJ_ATTR_CRT_ALL = 1, /* all certificates */
    GNUTLS_PKCS11_OBJ_ATTR_CRT_TRUSTED, /* certificates marked as trusted */
    GNUTLS_PKCS11_OBJ_ATTR_CRT_WITH_PRIVKEY, /* certificates with corresponding private key */
    GNUTLS_PKCS11_OBJ_ATTR_PUBKEY, /* public keys */
    GNUTLS_PKCS11_OBJ_ATTR_PRIVKEY, /* private keys */
    GNUTLS_PKCS11_OBJ_ATTR_ALL /* everything! */
} gnutls_pkcs11_obj_attr_t;
```

enum gnutls_pkcs11_token_info_t

```
typedef enum
{
    GNUTLS_PKCS11_TOKEN_LABEL,
    GNUTLS_PKCS11_TOKEN_SERIAL,
    GNUTLS_PKCS11_TOKEN_MANUFACTURER,
    GNUTLS_PKCS11_TOKEN_MODEL
} gnutls_pkcs11_token_info_t;
```

enum gnutls_pkcs11_obj_type_t

```
typedef enum
{
    GNUTLS_PKCS11_OBJ_UNKNOWN,
    GNUTLS_PKCS11_OBJ_X509_CRT,
    GNUTLS_PKCS11_OBJ_PUBKEY,
    GNUTLS_PKCS11_OBJ_PRIVKEY,
    GNUTLS_PKCS11_OBJ_SECRET_KEY,
    GNUTLS_PKCS11_OBJ_DATA
} gnutls_pkcs11_obj_type_t;
```

gnutls_pkcs11_token_init ()

int	gnutls_pkcs11_token_init	(const char *token_url, const char *so_pin, const char *label);
-----	--------------------------	---

This function will initialize (format) a token. If the token is at a factory defaults state the security officer's PIN given will be set to be the default. Otherwise it should match the officer's PIN.

token_url: A PKCS 11 URL specifying a token

so_pin: Security Officer's PIN

label: A name to be used for the token

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_token_get_mechanism ()

int	gnutls_pkcs11_token_get_mechanism	(const char *url, int idx, unsigned long *mechanism);
-----	-----------------------------------	---

This function will return the names of the supported mechanisms by the token. It should be called with an increasing index until it return **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE**.

url: should contain a PKCS 11 URL

idx: The index of the mechanism

mechanism: The PKCS 11 mechanism ID

Returns : zero on success or a negative value on error.

gnutls_pkcs11_token_set_pin ()

int	gnutls_pkcs11_token_set_pin	(const char *token_url, const char *oldpin, const char *newpin, unsigned int flags);
-----	-----------------------------	---

This function will modify or set a user's PIN for the given token. If it is called to set a user pin for first time the oldpin must be NULL.

token_url: A PKCS 11 URL specifying a token

oldpin: old user's PIN

newpin: new user's PIN

flags: one of gnutls_pkcs11_pin_flag_t

Returns : On success, GNUTLS_E_SUCCESS is returned, otherwise a negative error value.

gnutls_pkcs11_token_get_url ()

```
int gnutls_pkcs11_token_get_url (unsigned int seq,
                                gnutls_pkcs11_url_type_t detailed,
                                char **url);
```

This function will return the URL for each token available in system. The url has to be released using [gnutls_free\(\)](#)

seq: sequence number starting from 0

detailed: non zero if a detailed URL is required

url: will contain an allocated url

Returns : On success, GNUTLS_E_SUCCESS is returned, GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE if the sequence number exceeds the available tokens, otherwise a negative error value.

gnutls_pkcs11_token_get_info ()

```
int gnutls_pkcs11_token_get_info (const char *url,
                                 gnutls_pkcs11_token_info_t Param2,
                                 void *output,
                                 size_t *output_size);
```

This function will return information about the PKCS 11 token such as the label, id as well as token information where the key is stored.

url: should contain a PKCS 11 URL

Param2:

output: where output will be stored

output_size: contains the maximum size of the output and will be overwritten with actual

Returns : zero on success or a negative value on error.

GNUTLS_PKCS11_TOKEN_HW

```
#define GNUTLS_PKCS11_TOKEN_HW 1
```

gnutls_pkcs11_token_get_flags ()

```
int gnutls_pkcs11_token_get_flags (const char *url,
                                  unsigned int *flags);
```

This function will return information about the PKCS 11 token flags.

url: should contain a PKCS 11 URL

flags: The output flags (GNUTLS_PKCS11_TOKEN_*)

Returns : zero on success or a negative value on error.

gnutls_pkcs11_obj_list_import_url ()

```
int gnutls_pkcs11_obj_list_import_url (gnutls_pkcs11_obj_t *p_list,
                                     unsigned int *const n_list,
                                     const char *url,
                                     gnutls_pkcs11_obj_attr_t attrs,
                                     unsigned int flags);
```

This function will initialize and set values to an object list by using all objects identified by a PKCS 11 URL.

p_list : An uninitialized object list (may be NULL)

n_list : initially should hold the maximum size of the list. Will contain the actual size.

url : A PKCS 11 url identifying a set of objects

attrs : Attributes of type [gnutls_pkcs11_obj_attr_t](#) that can be used to limit output

flags : One of GNUTLS_PKCS11_OBJ_* flags

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_import_pkcs11 ()

```
int gnutls_x509_crt_import_pkcs11 (gnutls_x509_crt_t crt,
                                   gnutls_pkcs11_obj_t pkcs11_crt);
```

This function will import a PKCS 11 certificate to a [gnutls_x509_crt_t](#) structure.

crt : A certificate of type [gnutls_x509_crt_t](#)

pkcs11_crt :

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_x509_crt_import_pkcs11_url ()

```
int gnutls_x509_crt_import_pkcs11_url (gnutls_x509_crt_t crt,
                                       const char *url,
                                       unsigned int flags);
```

This function will import a PKCS 11 certificate directly from a token without involving the [gnutls_pkcs11_obj_t](#) structure. This function will fail if the certificate stored is not of X.509 type.

crt : A certificate of type [gnutls_x509_crt_t](#)

url : A PKCS 11 url

flags : One of GNUTLS_PKCS11_OBJ_* flags

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs11_obj_get_type ()

```
gnutls_pkcs11_obj_type_t gnutls_pkcs11_obj_get_type (gnutls_pkcs11_obj_t certificate);
```

This function will return the type of the certificate being stored in the structure.

certificate : Holds the PKCS 11 certificate

Returns : The type of the certificate.

gnutls_pkcs11_type_get_name ()

```
const char * gnutls_pkcs11_type_get_name (gnutls_pkcs11_obj_type_t Param1);
```

Param1 :

Returns :

gnutls_x509_crt_list_import_pkcs11 ()

```
int gnutls_x509_crt_list_import_pkcs11 (gnutls_x509_crt_t *certs,
                                         unsigned int cert_max,
                                         gnutls_pkcs11_obj_t * const pkcs11_certs,
                                         unsigned int flags);
```

This function will import a PKCS 11 certificate list to a list of [gnutls_x509_crt_t](#) structure. These must not be initialized.

certs :

cert_max : The maximum size of the list

pkcs11_certs :

flags : 0 for now

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_init ()

```
int gnutls_pkcs11_privkey_init (gnutls_pkcs11_privkey_t *key);
```

This function will initialize an private key structure.

key : The structure to be initialized

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_deinit ()

```
void gnutls_pkcs11_privkey_deinit (gnutls_pkcs11_privkey_t key);
```

This function will deinitialize a private key structure.

key : The structure to be initialized

gnutls_pkcs11_privkey_get_pk_algorithm ()

```
int gnutls_pkcs11_privkey_get_pk_algorithm (gnutls_pkcs11_privkey_t key,
                                            unsigned int *bits);
```

This function will return the public key algorithm of a private key.

key : should contain a [gnutls_pkcs11_privkey_t](#) structure

bits :

Returns : a member of the [gnutls_pk_algorithm_t](#) enumeration on success, or a negative value on error.

gnutls_pkcs11_privkey_get_info ()

```
int gnutls_pkcs11_privkey_get_info (gnutls_pkcs11_privkey_t crt,
                                   gnutls_pkcs11_obj_info_t itype,
                                   void *output,
                                   size_t *output_size);
```

This function will return information about the PKCS 11 private key such as the label, id as well as token information where the key is stored. When output is text it returns null terminated string although **output_size** contains the size of the actual data only.

crt :

itype : Denotes the type of information requested

output : where output will be stored

output_size : contains the maximum size of the output and will be overwritten with actual

Returns : zero on success or a negative value on error.

gnutls_pkcs11_privkey_import_url ()

```
int gnutls_pkcs11_privkey_import_url (gnutls_pkcs11_privkey_t key,
                                      const char *url,
                                      unsigned int flags);
```

This function will "import" a PKCS 11 URL identifying a private key to the **gnutls_pkcs11_privkey_t** structure. In reality since in most cases keys cannot be exported, the private key structure is being associated with the available operations on the token.

key :

url : a PKCS 11 url identifying the key

flags : sequence of GNUTLS_PKCS_PRIVKEY_*

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_sign_data ()

```
int gnutls_pkcs11_privkey_sign_data (gnutls_pkcs11_privkey_t signer,
                                     gnutls_digest_algorithm_t hash,
                                     unsigned int flags,
                                     const gnutls_datum_t *data,
                                     gnutls_datum_t *signature);
```

This function will sign the given data using a signature algorithm supported by the private key. Signature algorithms are always used together with a hash functions. Different hash functions may be used for the RSA algorithm, but only SHA-1 for the DSA keys.

signer : Holds the key

hash :

flags : should be 0 for now

data : holds the data to be signed

signature : will contain the signature allocated with **gnutls_malloc()**

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_sign_hash ()

```
int gnutls_pkcs11_privkey_sign_hash (gnutls_pkcs11_privkey_t key,
                                     const gnutls_datum_t *hash,
                                     gnutls_datum_t *signature);
```

This function will sign the given data using a signature algorithm supported by the private key. It is assumed that the given data are the output of a hash function.

key : Holds the key

hash : holds the data to be signed (should be output of a hash)

signature : will contain the signature allocated with [gnutls_malloc\(\)](#)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_decrypt_data ()

```
int gnutls_pkcs11_privkey_decrypt_data (gnutls_pkcs11_privkey_t key,
                                         unsigned int flags,
                                         const gnutls_datum_t *ciphertext,
                                         gnutls_datum_t *plaintext);
```

This function will decrypt the given data using the public key algorithm supported by the private key.

key : Holds the key

flags : should be 0 for now

ciphertext : holds the data to be signed

plaintext : will contain the plaintext, allocated with [gnutls_malloc\(\)](#)

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

gnutls_pkcs11_privkey_export_url ()

```
int gnutls_pkcs11_privkey_export_url (gnutls_pkcs11_privkey_t key,
                                       gnutls_pkcs11_url_type_t detailed,
                                       char **url);
```

This function will export a URL identifying the given key.

key : Holds the PKCS 11 key

detailed : non zero if a detailed URL is required

url : will contain an allocated url

Returns : On success, [GNUTLS_E_SUCCESS](#) is returned, otherwise a negative error value.

1.5 pkcs12

```

Description

Details

struct gnutls_pkcs12_int

```
struct gnutls_pkcs12_int;
```

gnutls_pkcs12_t

```
typedef struct gnutls_pkcs12_int *gnutls_pkcs12_t;
```

struct gnutls_pkcs12_bag_int

```
struct gnutls_pkcs12_bag_int;
```

gnutls_pkcs12_bag_t

```
typedef struct gnutls_pkcs12_bag_int *gnutls_pkcs12_bag_t;
```

gnutls_pkcs12_init ()

```
int gnutls_pkcs12_init (gnutls_pkcs12_t *pkcs12);
```

This function will initialize a PKCS12 structure. PKCS12 structures usually contain lists of X.509 Certificates and X.509 Certificate revocation lists.

pkcs12 : The structure to be initialized

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_deinit ()

```
void gnutls_pkcs12_deinit (gnutls_pkcs12_t pkcs12);
```

This function will deinitialize a PKCS12 structure.

pkcs12 : The structure to be initialized

gnutls_pkcs12_import ()

```
int gnutls_pkcs12_import(gnutls_pkcs12_t pkcs12,
                        const gnutls_datum_t *data,
                        gnutls_x509_crt_fmt_t format,
                        unsigned int flags);
```

This function will convert the given DER or PEM encoded PKCS12 to the native `gnutls_pkcs12_t` format. The output will be stored in `'pkcs12'`.

If the PKCS12 is PEM encoded it should have a header of "PKCS12".

pkcs12 : The structure to store the parsed PKCS12.

data : The DER or PEM encoded PKCS12.

format : One of DER or PEM

flags : an ORed sequence of `gnutls_privkey_pkcs8_flags`

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs12_export ()

```
int gnutls_pkcs12_export(gnutls_pkcs12_t pkcs12,
                        gnutls_x509_crt_fmt_t format,
                        void *output_data,
                        size_t *output_data_size);
```

This function will export the pkcs12 structure to DER or PEM format.

If the buffer provided is not long enough to hold the output, then `*output_data_size` will be updated and `GNUTLS_E_SHORT_MEMORY` will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN PKCS12".

pkcs12 : Holds the pkcs12 structure

format : the format of output params. One of PEM or DER.

output_data : will contain a structure PEM or DER encoded

output_data_size : holds the size of `output_data` (and will be replaced by the actual size of parameters)

Returns : In case of failure a negative value will be returned, and 0 on success.

gnutls_pkcs12_get_bag ()

```
int gnutls_pkcs12_get_bag(gnutls_pkcs12_t pkcs12,
                          int idx,
                          gnutls_pkcs12_bag_t bag);
```

This function will return a Bag from the PKCS12 structure.

After the last Bag has been read `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

pkcs12 : should contain a `gnutls_pkcs12_t` structure

idx : contains the index of the bag to extract

bag : An initialized bag, where the contents of the bag will be copied

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_pkcs12_set_bag ()

```
int gnutls_pkcs12_set_bag (gnutls_pkcs12_t pkcs12,  
                           gnutls_pkcs12_bag_t bag);
```

This function will insert a Bag into the PKCS12 structure.

pkcs12 : should contain a gnutls_pkcs12_t structure

bag : An initialized bag

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_generate_mac ()

```
int gnutls_pkcs12_generate_mac (gnutls_pkcs12_t pkcs12,  
                               const char *pass);
```

This function will generate a MAC for the PKCS12 structure.

pkcs12 : should contain a gnutls_pkcs12_t structure

pass : The password for the MAC

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_verify_mac ()

```
int gnutls_pkcs12_verify_mac (gnutls_pkcs12_t pkcs12,  
                             const char *pass);
```

This function will verify the MAC for the PKCS12 structure.

pkcs12 : should contain a gnutls_pkcs12_t structure

pass : The password for the MAC

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_bag_decrypt ()

```
int gnutls_pkcs12_bag_decrypt (gnutls_pkcs12_bag_t bag,  
                             const char *pass);
```

This function will decrypt the given encrypted bag and return 0 on success.

bag : The bag

pass : The password used for encryption, must be ASCII.

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_pkcs12_bag_encrypt ()

```
int gnutls_pkcs12_bag_encrypt (gnutls_pkcs12_bag_t bag,
                               const char *pass,
                               unsigned int flags);
```

This function will encrypt the given bag.

bag : The bag

pass : The password used for encryption, must be ASCII

flags : should be one of [gnutls_pkcs_encrypt_flags_t](#) elements bitwise or'd

Returns : On success, [GNUTLS_E_SUCCESS](#) (zero) is returned, otherwise an error code is returned.

enum gnutls_pkcs12_bag_type_t

```
typedef enum gnutls_pkcs12_bag_type_t
{
    GNUTLS_BAG_EMPTY = 0,
    GNUTLS_BAG_PKCS8_ENCRYPTED_KEY = 1,
    GNUTLS_BAG_PKCS8_KEY = 2,
    GNUTLS_BAG_CERTIFICATE = 3,
    GNUTLS_BAG_CRL = 4,
    GNUTLS_BAG_SECRET = 5, /* Secret data. Underspecified in pkcs-12,
                           * gnutls extension. We use the PKCS-9
                           * random nonce ID 1.2.840.113549.1.9.25.3
                           * to store randomly generated keys.
                           */
    GNUTLS_BAG_ENCRYPTED = 10,
    GNUTLS_BAG_UNKNOWN = 20
} gnutls_pkcs12_bag_type_t;
```

Enumeration of different PKCS 12 bag types.

GNUTLS_BAG_EMPTY Empty PKCS-12 bag.

GNUTLS_BAG_PKCS8_ENCRYPTED_KEY PKCS-12 bag with PKCS-8 encrypted key.

GNUTLS_BAG_PKCS8_KEY PKCS-12 bag with PKCS-8 key.

GNUTLS_BAG_CERTIFICATE PKCS-12 bag with certificate.

GNUTLS_BAG_CRL PKCS-12 bag with CRL.

GNUTLS_BAG_SECRET PKCS-12 bag with secret PKCS-9 keys.

GNUTLS_BAG_ENCRYPTED Encrypted PKCS-12 bag.

GNUTLS_BAG_UNKNOWN Unknown PKCS-12 bag.

gnutls_pkcs12_bag_get_type ()

```
gnutls_pkcs12_bag_type_t gnutls_pkcs12_bag_get_type (gnutls_pkcs12_bag_t bag,
                                                       int indx);
```

This function will return the bag's type.

bag : The bag

indx : The element of the bag to get the type

Returns : One of the [gnutls_pkcs12_bag_type_t](#) enumerations.

gnutls_pkcs12_bag_get_data ()

```
int gnutls_pkcs12_bag_get_data (gnutls_pkcs12_bag_t bag,
                               int indx,
                               gnutls_datum_t *data);
```

This function will return the bag's data. The data is a constant that is stored into the bag. Should not be accessed after the bag is deleted.

bag : The bag

indx : The element of the bag to get the data from

data : where the bag's data will be. Should be treated as constant.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_bag_set_data ()

```
int gnutls_pkcs12_bag_set_data (gnutls_pkcs12_bag_t bag,
                                gnutls_pkcs12_bag_type_t type,
                                const gnutls_datum_t *data);
```

This function will insert the given data of the given type into the bag.

bag : The bag

type : The data's type

data : the data to be copied.

Returns : the index of the added bag on success, or a negative value on error.

gnutls_pkcs12_bag_set_crl ()

```
int gnutls_pkcs12_bag_set_crl (gnutls_pkcs12_bag_t bag,
                               gnutls_x509_crl_t crl);
```

This function will insert the given CRL into the bag. This is just a wrapper over [gnutls_pkcs12_bag_set_data\(\)](#).

bag : The bag

crl : the CRL to be copied.

Returns : the index of the added bag on success, or a negative value on failure.

gnutls_pkcs12_bag_set_crt ()

```
int gnutls_pkcs12_bag_set_crt (gnutls_pkcs12_bag_t bag,
                               gnutls_x509_crt_t crt);
```

This function will insert the given certificate into the bag. This is just a wrapper over [gnutls_pkcs12_bag_set_data\(\)](#).

bag : The bag

crt : the certificate to be copied.

Returns : the index of the added bag on success, or a negative value on failure.

gnutls_pkcs12_bag_init ()

```
int gnutls_pkcs12_bag_init (gnutls_pkcs12_bag_t *bag);
```

This function will initialize a PKCS12 bag structure. PKCS12 Bags usually contain private keys, lists of X.509 Certificates and X.509 Certificate revocation lists.

bag : The structure to be initialized

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_pkcs12_bag_deinit ()

```
void gnutls_pkcs12_bag_deinit (gnutls_pkcs12_bag_t bag);
```

This function will deinitialize a PKCS12 Bag structure.

bag : The structure to be initialized

gnutls_pkcs12_bag_get_count ()

```
int gnutls_pkcs12_bag_get_count (gnutls_pkcs12_bag_t bag);
```

This function will return the number of the elements withing the bag.

bag : The bag

Returns : Number of elements in bag, or an negative error code on error.

gnutls_pkcs12_bag_get_key_id ()

```
int gnutls_pkcs12_bag_get_key_id (gnutls_pkcs12_bag_t bag,
                                 int idx,
                                 gnutls_datum_t *id);
```

This function will return the key ID, of the specified bag element. The key ID is usually used to distinguish the local private key and the certificate pair.

bag : The bag

idx : The bag's element to add the id

id : where the ID will be copied (to be treated as const)

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value. or a negative value on error.

gnutls_pkcs12_bag_set_key_id ()

```
int gnutls_pkcs12_bag_set_key_id (gnutls_pkcs12_bag_t bag,
                                 int idx,
                                 const gnutls_datum_t *id);
```

This function will add the given key ID, to the specified, by the index, bag element. The key ID will be encoded as a 'Local key identifier' bag attribute, which is usually used to distinguish the local private key and the certificate pair.

bag : The bag

idx : The bag's element to add the id

id : the ID

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value. or a negative value on error.

gnutls_pkcs12_bag_get_friendly_name ()

```
int gnutls_pkcs12_bag_get_friendly_name (gnutls_pkcs12_bag_t bag,  
                                         int indx,  
                                         char **name);
```

This function will return the friendly name, of the specified bag element. The key ID is usually used to distinguish the local private key and the certificate pair.

bag : The bag

idx : The bag's element to add the id

name : will hold a pointer to the name (to be treated as const)

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value, or a negative value on error.

gnutls_pkcs12_bag_set_friendly_name ()

This function will add the given key friendly name, to the specified, by the index, bag element. The name will be encoded as a 'Friendly name' bag attribute, which is usually used to set a user name to the local private key and the certificate pair.

bag : The bag

idx: The bag's element to add the id

name : the name

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value, or a negative value on error.

```

Description

Details

enum gnutls_openpgp_crt_fmt_t

```
typedef enum gnutls_openpgp_crt_fmt
{
    GNUTLS_OPENPGP_FMT_RAW,
    GNUTLS_OPENPGP_FMT_BASE64
} gnutls_openpgp_crt_fmt_t;
```

Enumeration of different OpenPGP key formats.

GNUTLS_OPENPGP_FMT_RAW OpenPGP certificate in raw format.

GNUTLS_OPENPGP_FMT_BASE64 OpenPGP certificate in base64 format.

gnutls_openpgp_keyid_t

```
typedef unsigned char gnutls_openpgp_keyid_t[8];
```

gnutls_openpgp_crt_init ()

```
int gnutls_openpgp_crt_init (gnutls_openpgp_crt_t *key);
```

This function will initialize an OpenPGP key structure.

key : The structure to be initialized

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_crt_deinit ()

```
void gnutls_openpgp_crt_deinit (gnutls_openpgp_crt_t key);
```

This function will deinitialize a key structure.

key : The structure to be initialized

gnutls_openpgp_crt_import ()

int	gnutls_openpgp_crt_import	(gnutls_openpgp_crt_t key, const gnutls_datum_t *data, gnutls_openpgp_crt_fmt_t format);
-----	---------------------------	--

This function will convert the given RAW or Base64 encoded key to the native [gnutls_openpgp_crt_t](#) format. The output will be stored in 'key'.

key : The structure to store the parsed key.

data : The RAW or BASE64 encoded key.

format : One of gnutls_openpgp_crt_fmt_t elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_crt_export ()

int	gnutls_openpgp_crt_export	(gnutls_openpgp_crt_t key, gnutls_openpgp_crt_fmt_t format, void *output_data, size_t *output_data_size);
-----	---------------------------	--

This function will convert the given key to RAW or Base64 format. If the buffer provided is not long enough to hold the output, then [GNUTLS_E_SHORT_MEMORY_BUFFER](#) will be returned.

key : Holds the key.

format : One of gnutls_openpgp_crt_fmt_t elements.

output_data : will contain the key base64 encoded or raw

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_crt_print ()

int	gnutls_openpgp_crt_print	(gnutls_openpgp_crt_t cert, gnutls_certificate_print_formats_t ← format, gnutls_datum_t *out);
-----	--------------------------	---

This function will pretty print an OpenPGP certificate, suitable for display to a human.

The format should be zero for future compatibility.

The output *out* needs to be deallocate using [gnutls_free\(\)](#).

cert : The structure to be printed

format : Indicate the format to use

out : Newly allocated datum with zero terminated string.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_crt_get_key_usage ()

```
int gnutls_openpgp_crt_get_key_usage (gnutls_openpgp_crt_t key,  
                                     unsigned int *key_usage);
```

This function will return certificate's key usage, by checking the key algorithm. The key usage value will ORed values of the: **GNUTLS_KEY_DIGITAL_SIGNATURE**, **GNUTLS_KEY_KEY_ENCIPHERMENT**.

key : should contain a gnutls_openpgp_crt_t structure

key_usage : where the key usage bits will be stored

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_crt_get_fingerprint ()

```
int gnutls_openpgp_crt_get_fingerprint (gnutls_openpgp_crt_t key,  
                                         void *fpr,  
                                         size_t *fprlen);
```

Get key fingerprint. Depending on the algorithm, the fingerprint can be 16 or 20 bytes.

key : the raw data that contains the OpenPGP public key.

fpr : the buffer to save the fingerprint, must hold at least 20 bytes.

fprlen : the integer to save the length of the fingerprint.

Returns : On success, 0 is returned. Otherwise, an error code.

gnutls_openpgp_crt_get_subkey_fingerprint ()

```
int gnutls_openpgp_crt_get_subkey_fingerprint  
      (gnutls_openpgp_crt_t key,  
       unsigned int idx,  
       void *fpr,  
       size_t *fprlen);
```

Get key fingerprint of a subkey. Depending on the algorithm, the fingerprint can be 16 or 20 bytes.

key : the raw data that contains the OpenPGP public key.

idx : the subkey index

fpr : the buffer to save the fingerprint, must hold at least 20 bytes.

fprlen : the integer to save the length of the fingerprint.

Returns : On success, 0 is returned. Otherwise, an error code.

Since 2.4.0

gnutls_openpgp_crt_get_name ()

```
int gnutls_openpgp_crt_get_name (gnutls_openpgp_crt_t key,
                                int idx,
                                char *buf,
                                size_t *sizeof_buf);
```

Extracts the userID from the parsed OpenPGP key.

key : the structure that contains the OpenPGP public key.

idx : the index of the ID to extract

buf : a pointer to a structure to hold the name, may be **NULL** to only get the *sizeof_buf*.

sizeof_buf : holds the maximum size of *buf*, on return hold the actual/required size of *buf*.

Returns : **GNUTLS_E_SUCCESS** on success, and if the index of the ID does not exist **GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE** or an error code.

gnutls_openpgp_crt_get_pk_algorithm ()

```
gnutls_pk_algorithm_t gnutls_openpgp_crt_get_pk_algorithm (gnutls_openpgp_crt_t key,
                                                          unsigned int *bits);
```

This function will return the public key algorithm of an OpenPGP certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

key : is an OpenPGP key

bits : if bits is non null it will hold the size of the parameters' in bits

Returns : a member of the **gnutls_pk_algorithm_t** enumeration on success, or a negative value on error.

gnutls_openpgp_crt_get_version ()

```
int gnutls_openpgp_crt_get_version (gnutls_openpgp_crt_t key);
```

Extract the version of the OpenPGP key.

key : the structure that contains the OpenPGP public key.

Returns : the version number is returned, or a negative value on errors.

gnutls_openpgp_crt_get_creation_time ()

```
time_t gnutls_openpgp_crt_get_creation_time (gnutls_openpgp_crt_t key);
```

Get key creation time.

key : the structure that contains the OpenPGP public key.

Returns : the timestamp when the OpenPGP key was created.

gnutls_openpgp_crt_get_expiration_time ()

```
time_t gnutls_openpgp_crt_get_expiration_time  
                                (gnutls_openpgp_crt_t key);
```

Get key expiration time. A value of '0' means that the key doesn't expire at all.

key : the structure that contains the OpenPGP public key.

Returns : the time when the OpenPGP key expires.

gnutls_openpgp_crt_get_key_id ()

```
int gnutls_openpgp_crt_get_key_id (gnutls_openpgp_crt_t key,  
                                  gnutls_openpgp_keyid_t keyid);
```

Get key id string.

key : the structure that contains the OpenPGP public key.

keyid : the buffer to save the keyid.

Returns : the 64-bit keyID of the OpenPGP key.

Since 2.4.0

gnutls_openpgp_crt_check_hostname ()

```
int gnutls_openpgp_crt_check_hostname (gnutls_openpgp_crt_t key,  
                                      const char *hostname);
```

This function will check if the given key's owner matches the given hostname. This is a basic implementation of the matching described in RFC2818 (HTTPS), which takes into account wildcards.

key : should contain a [gnutls_openpgp_crt_t](#) structure

hostname : A null terminated string that contains a DNS name

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_crt_get_revoked_status ()

```
int gnutls_openpgp_crt_get_revoked_status  
                                (gnutls_openpgp_crt_t key);
```

Get revocation status of key.

key : the structure that contains the OpenPGP public key.

Returns : true (1) if the key has been revoked, or false (0) if it has not.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_count ()

```
int gnutls_openpgp_crt_get_subkey_count (gnutls_openpgp_crt_t key);
```

This function will return the number of subkeys present in the given OpenPGP certificate.

key : is an OpenPGP key

Returns : the number of subkeys, or a negative value on error.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_idx ()

```
int gnutls_openpgp_crt_get_subkey_idx (gnutls_openpgp_crt_t key,
                                      const gnutls_openpgp_keyid_t keyid ↵
                                      );
```

Get subkey's index.

key : the structure that contains the OpenPGP public key.

keyid : the keyid.

Returns : the index of the subkey or a negative error value.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_revoked_status ()

```
int gnutls_openpgp_crt_get_subkey_revoked_status
                               (gnutls_openpgp_crt_t key,
                                unsigned int idx);
```

Get subkey revocation status. A negative value indicates an error.

key : the structure that contains the OpenPGP public key.

idx : is the subkey index

Returns : true (1) if the key has been revoked, or false (0) if it has not.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_pk_algorithm ()

```
gnutls_pk_algorithm_t gnutls_openpgp_crt_get_subkey_pk_algorithm
                           (gnutls_openpgp_crt_t key,
                            unsigned int idx,
                            unsigned int *bits);
```

This function will return the public key algorithm of a subkey of an OpenPGP certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

key : is an OpenPGP key

idx : is the subkey index

bits : if bits is non null it will hold the size of the parameters' in bits

Returns : a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

Since 2.4.0

`gnutls_openpgp_crt_get_subkey_creation_time ()`

```
time_t gnutls_openpgp_crt_get_subkey_creation_time
(gnutls_openpgp_crt_t key,
 unsigned int idx);
```

Get subkey creation time.

key : the structure that contains the OpenPGP public key.

idx : the subkey index

Returns : the timestamp when the OpenPGP sub-key was created.

Since 2.4.0

`gnutls_openpgp_crt_get_subkey_expiration_time ()`

```
time_t gnutls_openpgp_crt_get_subkey_expiration_time
(gnutls_openpgp_crt_t key,
 unsigned int idx);
```

Get subkey expiration time. A value of '0' means that the key doesn't expire at all.

key : the structure that contains the OpenPGP public key.

idx : the subkey index

Returns : the time when the OpenPGP key expires.

Since 2.4.0

`gnutls_openpgp_crt_get_subkey_id ()`

```
int gnutls_openpgp_crt_get_subkey_id (gnutls_openpgp_crt_t key,
                                     unsigned int idx,
                                     gnutls_openpgp_keyid_t keyid);
```

Get the subkey's key-id.

key : the structure that contains the OpenPGP public key.

idx : the subkey index

keyid : the buffer to save the keyid.

Returns : the 64-bit keyID of the OpenPGP key.

gnutls_openpgp_crt_get_subkey_usage ()

```
int gnutls_openpgp_crt_get_subkey_usage (gnutls_openpgp_crt_t key,  
                                       unsigned int idx,  
                                       unsigned int *key_usage);
```

This function will return certificate's key usage, by checking the key algorithm. The key usage value will ORed values of **GNUTLS_KEY_DIGITAL_SIGNATURE** or **GNUTLS_KEY_KEY_ENCIPHERMENT**.

A negative value may be returned in case of parsing error.

key : should contain a `gnutls_openpgp_crt_t` structure

idx : the subkey index

key_usage : where the key usage bits will be stored

Returns : key usage value.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_pk_dsa_raw ()

```
int gnutls_openpgp_crt_get_subkey_pk_dsa_raw  
      (gnutls_openpgp_crt_t crt,  
       unsigned int idx,  
       gnutls_datum_t *p,  
       gnutls_datum_t *q,  
       gnutls_datum_t *g,  
       gnutls_datum_t *y);
```

This function will export the DSA public key's parameters found in the given certificate. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

idx : Is the subkey index

p : will hold the p

q : will hold the q

g : will hold the g

y : will hold the y

Returns : **GNUTLS_E_SUCCESS** on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_crt_get_subkey_pk_rsa_raw ()

```
int gnutls_openpgp_crt_get_subkey_pk_rsa_raw  
      (gnutls_openpgp_crt_t crt,  
       unsigned int idx,  
       gnutls_datum_t *m,  
       gnutls_datum_t *e);
```

This function will export the RSA public key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

idx : Is the subkey index

m : will hold the modulus

e : will hold the public exponent

Returns : **GNUTLS_E_SUCCESS** on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_crt_get_pk_dsa_raw ()

```
int gnutls_openpgp_crt_get_pk_dsa_raw (gnutls_openpgp_crt_t crt,
                                         gnutls_datum_t *p,
                                         gnutls_datum_t *q,
                                         gnutls_datum_t *g,
                                         gnutls_datum_t *y);
```

This function will export the DSA public key's parameters found in the given certificate. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

p : will hold the p

q : will hold the q

g : will hold the g

y : will hold the y

Returns : **GNUTLS_E_SUCCESS** on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_crt_get_pk_rsa_raw ()

```
int gnutls_openpgp_crt_get_pk_rsa_raw (gnutls_openpgp_crt_t crt,
                                         gnutls_datum_t *m,
                                         gnutls_datum_t *e);
```

This function will export the RSA public key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

crt : Holds the certificate

m : will hold the modulus

e : will hold the public exponent

Returns : **GNUTLS_E_SUCCESS** on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_crt_get_preferred_key_id ()

```
int gnutls_openpgp_crt_get_preferred_key_id
    (gnutls_openpgp_crt_t key,
     gnutls_openpgp_keyid_t keyid);
```

Get preferred key id. If it hasn't been set it returns **GNUTLS_E_INVALID_REQUEST**.

key : the structure that contains the OpenPGP public key.

keyid : the struct to save the keyid.

Returns : the 64-bit preferred keyID of the OpenPGP key.

gnutls_openpgp_crt_set_preferred_key_id ()

```
int gnutls_openpgp_crt_set_preferred_key_id
    (gnutls_openpgp_crt_t key,
     const gnutls_openpgp_keyid_t keyid ↵
    );
```

This allows setting a preferred key id for the given certificate. This key will be used by functions that involve key handling.

key : the structure that contains the OpenPGP public key.

keyid : the selected keyid

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_openpgp_privkey_init ()

```
int gnutls_openpgp_privkey_init (gnutls_openpgp_privkey_t *key);
```

This function will initialize an OpenPGP key structure.

key : The structure to be initialized

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_privkey_deinit ()

```
void gnutls_openpgp_privkey_deinit (gnutls_openpgp_privkey_t key);
```

This function will deinitialize a key structure.

key : The structure to be initialized

gnutls_openpgp_privkey_get_pk_algorithm ()

```
gnutls_pk_algorithm_t gnutls_openpgp_privkey_get_pk_algorithm
                      (gnutls_openpgp_privkey_t key,
                       unsigned int *bits);
```

This function will return the public key algorithm of an OpenPGP certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

key : is an OpenPGP key

bits : if bits is non null it will hold the size of the parameters' in bits

Returns : a member of the [gnutls_pk_algorithm_t](#) enumeration on success, or a negative value on error.

Since 2.4.0

gnutls_openpgp_privkey_sec_param ()

```
gnutls_sec_param_t gnutls_openpgp_privkey_sec_param (gnutls_openpgp_privkey_t key);
```

This function will return the security parameter appropriate with this private key.

key : a key structure

Returns : On success, a valid security parameter is returned otherwise [GNUTLS_SEC_PARAM_UNKNOWN](#) is returned.

gnutls_openpgp_privkey_import ()

```
int gnutls_openpgp_privkey_import (gnutls_openpgp_privkey_t key,
                                   const gnutls_datum_t *data,
                                   gnutls_openpgp_crt_fmt_t format,
                                   const char *password,
                                   unsigned int flags);
```

This function will convert the given RAW or Base64 encoded key to the native `gnutls_openpgp_privkey_t` format. The output will be stored in 'key'.

key : The structure to store the parsed key.

data : The RAW or BASE64 encoded key.

format : One of [gnutls_openpgp_crt_fmt_t](#) elements.

password : not used for now

flags : should be zero

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_privkey_decrypt_data ()

```
int gnutls_openpgp_privkey_decrypt_data (gnutls_openpgp_privkey_t key,  
                                       unsigned int flags,  
                                       const gnutls_datum_t *ciphertext,  
                                       gnutls_datum_t *plaintext);
```

This function will sign the given hash using the private key. You should use [gnutls_openpgp_privkey_set_preferred_key_id\(\)](#) before calling this function to set the subkey to use.

key : Holds the key

flags : zero for now

ciphertext : holds the data to be decrypted

plaintext : will contain newly allocated plaintext

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_openpgp_privkey_sign_hash ()

```
int gnutls_openpgp_privkey_sign_hash (gnutls_openpgp_privkey_t key,  
                                      const gnutls_datum_t *hash,  
                                      gnutls_datum_t *signature);
```

This function will sign the given hash using the private key. You should use [gnutls_openpgp_privkey_set_preferred_key_id\(\)](#) before calling this function to set the subkey to use.

key : Holds the key

hash : holds the data to be signed

signature : will contain newly allocated signature

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_openpgp_privkey_get_fingerprint ()

```
int gnutls_openpgp_privkey_get_fingerprint (gnutls_openpgp_privkey_t key,  
                                           void *fpr,  
                                           size_t *fprlen);
```

Get the fingerprint of the OpenPGP key. Depends on the algorithm, the fingerprint can be 16 or 20 bytes.

key : the raw data that contains the OpenPGP secret key.

fpr : the buffer to save the fingerprint, must hold at least 20 bytes.

fprlen : the integer to save the length of the fingerprint.

Returns : On success, 0 is returned, or an error code.

Since 2.4.0

gnutls_openpgp_privkey_get_subkey_fingerprint ()

```
int gnutls_openpgp_privkey_get_subkey_fingerprint
    (gnutls_openpgp_privkey_t key,
     unsigned int idx,
     void *fpr,
     size_t *fprlen);
```

Get the fingerprint of an OpenPGP subkey. Depends on the algorithm, the fingerprint can be 16 or 20 bytes.

key : the raw data that contains the OpenPGP secret key.

idx : the subkey index

fpr : the buffer to save the fingerprint, must hold at least 20 bytes.

fprlen : the integer to save the length of the fingerprint.

Returns : On success, 0 is returned, or an error code.

Since 2.4.0

gnutls_openpgp_privkey_get_key_id ()

```
int gnutls_openpgp_privkey_get_key_id (gnutls_openpgp_privkey_t key,
                                      gnutls_openpgp_keyid_t keyid);
```

Get key-id.

key : the structure that contains the OpenPGP secret key.

keyid : the buffer to save the keyid.

Returns : the 64-bit keyID of the OpenPGP key.

Since 2.4.0

gnutls_openpgp_privkey_get_subkey_count ()

```
int gnutls_openpgp_privkey_get_subkey_count
    (gnutls_openpgp_privkey_t key);
```

This function will return the number of subkeys present in the given OpenPGP certificate.

key : is an OpenPGP key

Returns : the number of subkeys, or a negative value on error.

Since 2.4.0

gnutls_openpgp_privkey_get_subkey_idx ()

```
int gnutls_openpgp_privkey_get_subkey_idx
(gnutls_openpgp_privkey_t key,
 const gnutls_openpgp_keyid_t keyid ↵
);
```

Get index of subkey.

key : the structure that contains the OpenPGP private key.

keyid : the keyid.

Returns : the index of the subkey or a negative error value.

Since 2.4.0

gnutls_openpgp_privkey_get_subkey_revoked_status ()

```
int gnutls_openpgp_privkey_get_subkey_revoked_status
(gnutls_openpgp_privkey_t key,
 unsigned int idx);
```

Get revocation status of key.

key : the structure that contains the OpenPGP private key.

idx : is the subkey index

Returns : true (1) if the key has been revoked, or false (0) if it has not, or a negative value indicates an error.

Since 2.4.0

gnutls_openpgp_privkey_get_revoked_status ()

```
int gnutls_openpgp_privkey_get_revoked_status
(gnutls_openpgp_privkey_t key);
```

Get revocation status of key.

key : the structure that contains the OpenPGP private key.

Returns : true (1) if the key has been revoked, or false (0) if it has not, or a negative value indicates an error.

Since 2.4.0

gnutls_openpgp_privkey_get_subkey_pk_algorithm ()

```
gnutls_pk_algorithm_t gnutls_openpgp_privkey_get_subkey_pk_algorithm
(gnutls_openpgp_privkey_t key,
 unsigned int idx,
 unsigned int *bits);
```

This function will return the public key algorithm of a subkey of an OpenPGP certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

key : is an OpenPGP key

idx : is the subkey index

bits : if bits is non null it will hold the size of the parameters' in bits

Returns : a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

Since 2.4.0

`gnutls_openpgp_privkey_get_subkey_expiration_time ()`

```
time_t gnutls_openpgp_privkey_get_subkey_expiration_time
(gnutls_openpgp_privkey_t key,
 unsigned int idx);
```

Get subkey expiration time. A value of '0' means that the key doesn't expire at all.

key : the structure that contains the OpenPGP private key.

idx : the subkey index

Returns : the time when the OpenPGP key expires.

Since 2.4.0

`gnutls_openpgp_privkey_get_subkey_id ()`

```
int gnutls_openpgp_privkey_get_subkey_id
(gnutls_openpgp_privkey_t key,
 unsigned int idx,
 gnutls_openpgp_keyid_t keyid);
```

Get the key-id for the subkey.

key : the structure that contains the OpenPGP secret key.

idx : the subkey index

keyid : the buffer to save the keyid.

Returns : the 64-bit keyID of the OpenPGP key.

Since 2.4.0

`gnutls_openpgp_privkey_get_subkey_creation_time ()`

```
time_t gnutls_openpgp_privkey_get_subkey_creation_time
(gnutls_openpgp_privkey_t key,
 unsigned int idx);
```

Get subkey creation time.

key : the structure that contains the OpenPGP private key.

idx : the subkey index

Returns : the timestamp when the OpenPGP key was created.

Since 2.4.0

gnutls_openpgp_privkey_export_subkey_dsa_raw ()

```
int gnutls_openpgp_privkey_export_subkey_dsa_raw
(gnutls_openpgp_privkey_t pkey,
 unsigned int idx,
 gnutls_datum_t *p,
 gnutls_datum_t *q,
 gnutls_datum_t *g,
 gnutls_datum_t *y,
 gnutls_datum_t *x);
```

This function will export the DSA private key's parameters found in the given certificate. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

pkey : Holds the certificate

idx : Is the subkey index

p : will hold the p

q : will hold the q

g : will hold the g

y : will hold the y

x : will hold the x

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_privkey_export_subkey_rsa_raw ()

```
int gnutls_openpgp_privkey_export_subkey_rsa_raw
(gnutls_openpgp_privkey_t pkey,
 unsigned int idx,
 gnutls_datum_t *m,
 gnutls_datum_t *e,
 gnutls_datum_t *d,
 gnutls_datum_t *p,
 gnutls_datum_t *q,
 gnutls_datum_t *u);
```

This function will export the RSA private key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

pkey : Holds the certificate

idx : Is the subkey index

m : will hold the modulus

e : will hold the public exponent

d : will hold the private exponent

p : will hold the first prime (p)

q : will hold the second prime (q)

u : will hold the coefficient

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_privkey_export_dsa_raw ()

```
int gnutls_openpgp_privkey_export_dsa_raw
(gnutls_openpgp_privkey_t pkey,
 gnutls_datum_t *p,
 gnutls_datum_t *q,
 gnutls_datum_t *g,
 gnutls_datum_t *y,
 gnutls_datum_t *x);
```

This function will export the DSA private key's parameters found in the given certificate. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

pkey : Holds the certificate

p : will hold the p

q : will hold the q

g : will hold the g

y : will hold the y

x : will hold the x

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_privkey_export_rsa_raw ()

```
int gnutls_openpgp_privkey_export_rsa_raw
(gnutls_openpgp_privkey_t pkey,
 gnutls_datum_t *m,
 gnutls_datum_t *e,
 gnutls_datum_t *d,
 gnutls_datum_t *p,
 gnutls_datum_t *q,
 gnutls_datum_t *u);
```

This function will export the RSA private key's parameters found in the given structure. The new parameters will be allocated using [gnutls_malloc\(\)](#) and will be stored in the appropriate datum.

pkey : Holds the certificate

m : will hold the modulus

e : will hold the public exponent

d : will hold the private exponent

p : will hold the first prime (p)

q : will hold the second prime (q)

u : will hold the coefficient

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.4.0

gnutls_openpgp_privkey_export ()

```
int gnutls_openpgp_privkey_export(gnutls_openpgp_privkey_t key,
                                 gnutls_openpgp_crt_fmt_t format,
                                 const char *password,
                                 unsigned int flags,
                                 void *output_data,
                                 size_t *output_data_size);
```

This function will convert the given key to RAW or Base64 format. If the buffer provided is not long enough to hold the output, then GNUTLS_E_SHORT_MEMORY_BUFFER will be returned.

key : Holds the key.

format : One of gnutls_openpgp_crt_fmt_t elements.

password : the password that will be used to encrypt the key. (unused for now)

flags : zero for future compatibility

output_data : will contain the key base64 encoded or raw

output_data_size : holds the size of output_data (and will be replaced by the actual size of parameters)

Returns : GNUTLS_E_SUCCESS on success, or an error code.

Since 2.4.0

gnutls_openpgp_privkey_set_preferred_key_id ()

```
int gnutls_openpgp_privkey_set_preferred_key_id(gnutls_openpgp_privkey_t key,
                                                const gnutls_openpgp_keyid_t keyid ↵
                                                );
```

This allows setting a preferred key id for the given certificate. This key will be used by functions that involve key handling.

key : the structure that contains the OpenPGP public key.

keyid : the selected keyid

Returns : On success, 0 is returned, or an error code.

gnutls_openpgp_privkey_get_preferred_key_id ()

```
int gnutls_openpgp_privkey_get_preferred_key_id(gnutls_openpgp_privkey_t key,
                                                gnutls_openpgp_keyid_t keyid);
```

Get the preferred key-id for the key.

key : the structure that contains the OpenPGP public key.

keyid : the struct to save the keyid.

Returns : the 64-bit preferred keyID of the OpenPGP key, or if it hasn't been set it returns GNUTLS_E_INVALID_REQUEST.

gnutls_openpgp_crt_get_auth_subkey ()

```
int gnutls_openpgp_crt_get_auth_subkey (gnutls_openpgp_crt_t crt,
                                      gnutls_openpgp_keyid_t keyid,
                                      unsigned int flag);
```

Returns the 64-bit keyID of the first valid OpenPGP subkey marked for authentication. If flag is non zero and no authentication subkey exists, then a valid subkey will be returned even if it is not marked for authentication. Returns the 64-bit keyID of the first valid OpenPGP subkey marked for authentication. If flag is non zero and no authentication subkey exists, then a valid subkey will be returned even if it is not marked for authentication.

crt : the structure that contains the OpenPGP public key.

keyid : the struct to save the keyid.

flag : Non zero indicates that a valid subkey is always returned.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_keyring_init ()

```
int gnutls_openpgp_keyring_init (gnutls_openpgp_keyring_t *keyring) ←
```

This function will initialize an keyring structure.

keyring : The structure to be initialized

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_keyring_deinit ()

```
void gnutls_openpgp_keyring_deinit (gnutls_openpgp_keyring_t keyring);
```

This function will deinitialize a keyring structure.

keyring : The structure to be initialized

gnutls_openpgp_keyring_import ()

```
int gnutls_openpgp_keyring_import (gnutls_openpgp_keyring_t keyring,
                                   const gnutls_datum_t *data,
                                   gnutls_openpgp_crt_fmt_t format);
```

This function will convert the given RAW or Base64 encoded keyring to the native [gnutls_openpgp_keyring_t](#) format. The output will be stored in 'keyring'.

keyring : The structure to store the parsed key.

data : The RAW or BASE64 encoded keyring.

format : One of [gnutls_openpgp_keyring_fmt](#) elements.

Returns : [GNUTLS_E_SUCCESS](#) on success, or an error code.

gnutls_openpgp_keyring_check_id ()

```
int gnutls_openpgp_keyring_check_id (gnutls_openpgp_keyring_t ring,
                                    const gnutls_openpgp_keyid_t keyid ←
                                    ,
                                    unsigned int flags);
```

Check if a given key ID exists in the keyring.

ring : holds the keyring to check against

keyid : will hold the keyid to check for.

flags : unused (should be 0)

Returns : **GNUTLS_E_SUCCESS** on success (if keyid exists) and a negative error code on failure.

gnutls_openpgp_crt_verify_ring ()

```
int gnutls_openpgp_crt_verify_ring (gnutls_openpgp_crt_t key,
                                    gnutls_openpgp_keyring_t keyring,
                                    unsigned int flags,
                                    unsigned int *verify);
```

Verify all signatures in the key, using the given set of keys (keyring).

The key verification output will be put in **verify** and will be one or more of the **gnutls_certificate_status_t** enumerated elements bitwise or'd.

GNUTLS_CERT_INVALID: A signature on the key is invalid.

GNUTLS_CERT_REVOKED: The key has been revoked.

Note that this function does not verify using any "web of trust". You may use GnuPG for that purpose, or any other external PGP application.

key : the structure that holds the key.

keyring : holds the keyring to check against

flags : unused (should be 0)

verify : will hold the certificate verification output.

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_crt_verify_self ()

```
int gnutls_openpgp_crt_verify_self (gnutls_openpgp_crt_t key,
                                    unsigned int flags,
                                    unsigned int *verify);
```

Verifies the self signature in the key. The key verification output will be put in **verify** and will be one or more of the **gnutls_certificate_status_t** enumerated elements bitwise or'd.

GNUTLS_CERT_INVALID: The self signature on the key is invalid.

key : the structure that holds the key.

flags : unused (should be 0)

verify : will hold the key verification output.

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_keyring_get_crt ()

```
int gnutls_openpgp_keyring_get_crt (gnutls_openpgp_keyring_t ring,
                                   unsigned int idx,
                                   gnutls_openpgp_crt_t *cert);
```

This function will extract an OpenPGP certificate from the given keyring. If the index given is out of range **GNUTLS_E_REQUESTED_INDEX_OUT_OF_RANGE** will be returned. The returned structure needs to be deinitiated.

ring : Holds the keyring.

idx : the index of the certificate to export

cert : An uninitialized **gnutls_openpgp_crt_t** structure

Returns : **GNUTLS_E_SUCCESS** on success, or an error code.

gnutls_openpgp_keyring_get_crt_count ()

```
int gnutls_openpgp_keyring_get_crt_count (gnutls_openpgp_keyring_t ring);
```

This function will return the number of OpenPGP certificates present in the given keyring.

ring : is an OpenPGP key ring

Returns : the number of subkeys, or a negative value on error.

gnutls_openpgp_recv_key_func ()

```
int (*gnutls_openpgp_recv_key_func) (gnutls_session_t session,
                                    unsigned char *keyfpr,
                                    unsigned int keyfpr_length,
                                    gnutls_datum_t *key);
```

A callback of this type is used to retrieve OpenPGP keys. Only useful on the server, and will only be used if the peer send a key fingerprint instead of a full key. See also [gnutls_openpgp_set_recv_key_function\(\)](#).

session : a TLS session

keyfpr : key fingerprint

keyfpr_length : length of key fingerprint

key : output key.

Returns : On success, **GNUTLS_E_SUCCESS** (zero) is returned, otherwise an error code is returned.

gnutls_openpgp_set_recv_key_function ()

```
void gnutls_openpgp_set_recv_key_function (gnutls_session_t session,
                                         gnutls_openpgp_recv_key_func func) ←
                                         ;
```

This function will set a key retrieval function for OpenPGP keys. This callback is only useful in server side, and will be used if the peer sent a key fingerprint instead of a full key.

session : a TLS session

func : the callback

gnutls_certificate_set_openpgp_key ()

```
int gnutls_certificate_set_openpgp_key (gnutls_certificate_credentials_t *res,
                                     gnutls_openpgp_crt_t key,
                                     gnutls_openpgp_privkey_t pkey);
```

This function sets a certificate/private key pair in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

With this function the subkeys of the certificate are not used.

res : is a `gnutls_certificate_credentials_t` structure.

key : contains an openpgp public key

pkey : is an openpgp private key

Returns : On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_certificate_set_openpgp_key_file ()

```
int gnutls_certificate_set_openpgp_key_file (gnutls_certificate_credentials_t *res,
                                            const char *certfile,
                                            const char *keyfile,
                                            gnutls_openpgp_crt_fmt_t format);
```

This funtion is used to load OpenPGP keys into the GnuTLS credentials structure. The files should only contain one key which is not encrypted.

res : the destination context to save the data.

certfile : the file that contains the public key.

keyfile : the file that contains the secret key.

format : the format of the keys

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_certificate_set_openpgp_key_mem ()

```
int gnutls_certificate_set_openpgp_key_mem (gnutls_certificate_credentials_t *res,
                                           const gnutls_datum_t *cert,
                                           const gnutls_datum_t *key,
                                           gnutls_openpgp_crt_fmt_t format);
```

This funtion is used to load OpenPGP keys into the GnuTLS credential structure. The files should contain non encrypted keys.

res : the destination context to save the data.

cert : the datum that contains the public key.

key : the datum that contains the secret key.

format : the format of the keys

Returns : On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_certificate_set_openssl_key_file2 ()

```
int gnutls_certificate_set_openssl_key_file2
(gnutls_certificate_credentials_t *res,
 const char *certfile,
 const char *keyfile,
 const char *subkey_id,
 gnutls_openssl_crt_fmt_t format);
```

This function is used to load OpenPGP keys into the GnuTLS credential structure. The files should contain non encrypted keys. The special keyword "auto" is also accepted as *subkey_id*. In that case the [gnutls_openssl_crt_get_auth_subkey\(\)](#) will be used to retrieve the subkey.

res : the destination context to save the data.

certfile : the file that contains the public key.

keyfile : the file that contains the secret key.

subkey_id : a hex encoded subkey id

format : the format of the keys

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.4.0

gnutls_certificate_set_openssl_key_mem2 ()

```
int gnutls_certificate_set_openssl_key_mem2
(gnutls_certificate_credentials_t *res,
 const gnutls_datum_t *cert,
 const gnutls_datum_t *key,
 const char *subkey_id,
 gnutls_openssl_crt_fmt_t format);
```

This function is used to load OpenPGP keys into the GnuTLS credentials structure. The files should only contain one key which is not encrypted.

The special keyword "auto" is also accepted as *subkey_id*. In that case the [gnutls_openssl_crt_get_auth_subkey\(\)](#) will be used to retrieve the subkey.

res : the destination context to save the data.

cert : the datum that contains the public key.

key : the datum that contains the secret key.

subkey_id : a hex encoded subkey id

format : the format of the keys

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

Since 2.4.0

gnutls_certificate_set_openpgp_keyring_mem ()

```
int gnutls_certificate_set_openpgp_keyring_mem
(gnutls_certificate_credentials_t c ←
'',
unsigned char *data,
size_t dlen,
gnutls_openpgp_crt_fmt_t format);
```

The function is used to set keyrings that will be used internally by various OpenPGP functions. For example to find a key when it is needed for an operations. The keyring will also be used at the verification functions.

c : A certificate credentials structure

data : buffer with keyring data.

dlen : length of data buffer.

format : the format of the keyring

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

gnutls_certificate_set_openpgp_keyring_file ()

```
int gnutls_certificate_set_openpgp_keyring_file
(gnutls_certificate_credentials_t c ←
'',
const char *file,
gnutls_openpgp_crt_fmt_t format);
```

The function is used to set keyrings that will be used internally by various OpenPGP functions. For example to find a key when it is needed for an operations. The keyring will also be used at the verification functions.

c : A certificate credentials structure

file : filename of the keyring.

format : format of keyring.

Returns : On success, **GNUTLS_E_SUCCESS** is returned, otherwise a negative error value.

```

Description

Details

gnutls_cipher_hd_t

```
typedef struct cipher_hd_st *gnutls_cipher_hd_t;
```

gnutls_cipher_init ()

```
int gnutls_cipher_init (gnutls_cipher_hd_t *handle,  
                      gnutls_cipher_algorithm_t cipher,  
                      const gnutls_datum_t *key,  
                      const gnutls_datum_t *iv);
```

This function will initialize an context that can be used for encryption/decryption of data. This will effectively use the current crypto backend in use by gnutls or the cryptographic accelerator in use.

handle : is a `gnutls_cipher_hd_t` structure.

cipher : the encryption algorithm to use

key : The key to be used for encryption

iv : The IV to use (if not applicable set NULL)

Returns : Zero or a negative value on error.

Since 2.10.0

`gnutls_cipher_encrypt ()`

```
int gnutls_cipher_encrypt (const gnutls_cipher_hd_t handle,  
                          void *text,  
                          size_t textlen);
```

This function will encrypt the given data using the algorithm specified by the context.

handle : is a `gnutls_cipher_hd_t` structure.

text : the data to encrypt

textlen : The length of data to encrypt

Returns : Zero or a negative value on error.

Since 2.10.0

`gnutls_cipher_decrypt ()`

```
int gnutls_cipher_decrypt (const gnutls_cipher_hd_t handle,  
                           void *ciphertext,  
                           size_t ciphertextlen);
```

This function will decrypt the given data using the algorithm specified by the context.

handle : is a `gnutls_cipher_hd_t` structure.

ciphertext : the data to encrypt

ciphertextlen : The length of data to encrypt

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_cipher_decrypt2 ()

```
int gnutls_cipher_decrypt2 (gnutls_cipher_hd_t handle,
                           const void *ciphertext,
                           size_t ciphertextlen,
                           void *text,
                           size_t textlen);
```

This function will decrypt the given data using the algorithm specified by the context.

handle : is a [gnutls_cipher_hd_t](#) structure.

ciphertext : the data to encrypt

ciphertextlen : The length of data to encrypt

text : the decrypted data

textlen : The available length for decrypted data

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_cipher_encrypt2 ()

```
int gnutls_cipher_encrypt2 (gnutls_cipher_hd_t handle,
                           void *text,
                           size_t textlen,
                           void *ciphertext,
                           size_t ciphertextlen);
```

This function will encrypt the given data using the algorithm specified by the context.

handle : is a [gnutls_cipher_hd_t](#) structure.

text : the data to encrypt

textlen : The length of data to encrypt

ciphertext : the encrypted data

ciphertextlen : The available length for encrypted data

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_cipher_deinit ()

```
void gnutls_cipher_deinit (gnutls_cipher_hd_t handle);
```

This function will deinitialize all resources occupied by the given encryption context.

handle : is a [gnutls_cipher_hd_t](#) structure.

Since 2.10.0

gnutls_cipher_get_block_size ()

```
int gnutls_cipher_get_block_size (gnutls_cipher_algorithm_t *algorithm);
```

Get block size for encryption algorithm.

algorithm : is an encryption algorithm

Returns : block size for encryption algorithm.

Since 2.10.0

gnutls_hash_hd_t

```
typedef struct hash_hd_st *gnutls_hash_hd_t;
```

gnutls_hmac_hd_t

```
typedef struct hmac_hd_st *gnutls_hmac_hd_t;
```

gnutls_hmac_init ()

```
int gnutls_hmac_init (gnutls_hmac_hd_t *dig, gnutls_digest_algorithm_t *algorithm, const void *key, size_t keylen);
```

This function will initialize an context that can be used to produce a Message Authentication Code (MAC) of data. This will effectively use the current crypto backend in use by gnutls or the cryptographic accelerator in use.

dig : is a [gnutls_hmac_hd_t](#) structure.

algorithm : the HMAC algorithm to use

key : The key to be used for encryption

keylen : The length of the key

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_hmac ()

```
int gnutls_hmac (gnutls_hmac_hd_t handle, const void *text, size_t textlen);
```

This function will hash the given data using the algorithm specified by the context.

handle : is a [gnutls_hmac_hd_t](#) structure.

text : the data to hash

textlen : The length of data to hash

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_hmac_output ()

```
void gnutls_hmac_output(gnutls_hmac_hd_t handle,  
void *digest);
```

This function will output the current MAC value.

handle : is a [gnutls_hmac_hd_t](#) structure.

digest : is the output value of the MAC

Since 2.10.0

gnutls_hmac_deinit ()

```
void gnutls_hmac_deinit(gnutls_hmac_hd_t handle,  
void *digest);
```

This function will deinitialize all resources occupied by the given hmac context.

handle : is a [gnutls_hmac_hd_t](#) structure.

digest : is the output value of the MAC

Since 2.10.0

gnutls_hmac_get_len ()

```
int gnutls_hmac_get_len(gnutls_mac_algorithm_t algorithm);
```

This function will return the length of the output data of the given hmac algorithm.

algorithm : the hmac algorithm to use

Returns : The length or zero on error.

Since 2.10.0

gnutls_hmac_fast ()

```
int gnutls_hmac_fast(gnutls_mac_algorithm_t algorithm,  
const void *key,  
size_t keylen,  
const void *text,  
size_t textlen,  
void *digest);
```

This convenience function will hash the given data and return output on a single call.

algorithm : the hash algorithm to use

key : the key to use

keylen : The length of the key

text : the data to hash

textlen : The length of data to hash

digest : is the output value of the hash

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_hash_init ()

```
int gnutls_hash_init (gnutls_hash_hd_t *dig,  
                      gnutls_digest_algorithm_t algorithm);
```

This function will initialize an context that can be used to produce a Message Digest of data. This will effectively use the current crypto backend in use by gnutls or the cryptographic accelerator in use.

dig : is a [gnutls_hash_hd_t](#) structure.

algorithm : the hash algorithm to use

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_hash ()

```
int gnutls_hash (gnutls_hash_hd_t handle,  
                const void *text,  
                size_t textlen);
```

This function will hash the given data using the algorithm specified by the context.

handle : is a [gnutls_cipher_hd_t](#) structure.

text : the data to hash

textlen : The length of data to hash

Returns : Zero or a negative value on error.

Since 2.10.0

gnutls_hash_output ()

```
void gnutls_hash_output (gnutls_hash_hd_t handle,  
                        void *digest);
```

This function will output the current hash value.

handle : is a [gnutls_hash_hd_t](#) structure.

digest : is the output value of the hash

Since 2.10.0

gnutls_hash_deinit ()

```
void gnutls_hash_deinit (gnutls_hash_hd_t handle,  
                        void *digest);
```

This function will deinitialize all resources occupied by the given hash context.

handle : is a [gnutls_hash_hd_t](#) structure.

digest : is the output value of the hash

Since 2.10.0

gnutls_hash_get_len ()

```
int gnutls_hash_get_len (gnutls_digest_algorithm_t *algorithm);
```

This function will return the length of the output data of the given hash algorithm.

algorithm: the hash algorithm to use

Returns : The length or zero on error.

Since 2.10.0

gnutls_hash_fast ()

```
int gnutls_hash_fast (gnutls_digest_algorithm_t *algorithm,
                      const void *text,
                      size_t textlen,
                      void *digest);
```

This convenience function will hash the given data and return output on a single call.

algorithm: the hash algorithm to use

text: the data to hash

textlen: The length of data to hash

digest: is the output value of the hash

Returns : Zero or a negative value on error.

Since 2.10.0

GNUTLS_CRYPTO_API_VERSION

```

ctx:**hash ()**

```
int          (*hash)              (void *ctx,
                                    const void *text,
                                    size_t textszie);
```

ctx:**text:****textszie:****Returns :****output ()**

```
int          (*output)            (void *src_ctx,
                                    void *digest,
                                    size_t digestsize);
```

src_ctx:**digest:****digestsize:****Returns :**

copy ()

```
int (*copy) (void **dst_ctx,
             void *src_ctx);
```

dst_ctx :

src_ctx :

Returns :

enum gnutls_rnd_level_t

```
typedef enum gnutls_rnd_level
{
    GNUTLS_RND_NONCE = 0,
    GNUTLS_RND_RANDOM = 1,
    GNUTLS_RND_KEY = 2
} gnutls_rnd_level_t;
```

Enumeration of random quality levels.

GNUTLS_RND_NONCE Non-predictable random number. Fatal in parts of session if broken, i.e., vulnerable to statistical analysis.

GNUTLS_RND_RANDOM Pseudo-random cryptographic random number. Fatal in session if broken.

GNUTLS_RND_KEY Fatal in many sessions if broken.

gnutls_rnd ()

```
int gnutls_rnd (gnutls_rnd_level_t level,
                void *data,
                size_t len);
```

This function will generate random data and store it to output buffer.

level : a security level

data : place to store random bytes

len : The requested size

Returns : Zero or a negative value on error.

enum gnutls_pk_flag_t

```
typedef enum
{
    GNUTLS_PK_FLAG_NONE = 0
} gnutls_pk_flag_t;
```

Enumeration of public-key flag.

GNUTLS_PK_FLAG_NONE No flag.

rnd ()

```
int (*rnd) (void *ctx,
            int level,
            void *data,
            size_t datasize);
```

ctx:***level:******data:******datasize:******Returns :*****bigint_t**

```
typedef void *bigint_t;
```

enum gnutls_bigint_format_t

```
typedef enum
{
    /* raw unsigned integer format */
    GNUTLS_MPI_FORMAT_USG = 0,
    /* raw signed integer format - always a leading zero when positive */
    GNUTLS_MPI_FORMAT_STD = 1,
    /* the pgp integer format */
    GNUTLS_MPI_FORMAT_PGP = 2
} gnutls_bigint_format_t;
```

Enumeration of different bignum integer encoding formats.

GNUTLS_MPI_FORMAT_USG Raw unsigned integer format.

GNUTLS_MPI_FORMAT_STD Raw signed integer format, always a leading zero when positive.

GNUTLS_MPI_FORMAT_PGP The pgp integer format.

bigint_new ()

```
bigint_t (*bigint_new) (int nbits);
```

nbits:***Returns :*****bigint_release ()**

```
void (*bigint_release) (bigint_t n);
```

n:

bigint_cmp ()

```
int          (*bigint_cmp)           (const bigint_t m1,  
                                     const bigint_t m2);
```

m1 :

m2 :

Returns :

bigint_cmp_ui ()

```
int          (*bigint_cmp_ui)        (const bigint_t m1,  
                                       unsigned long m2);
```

m1 :

m2 :

Returns :

bigint_mod ()

```
bigint_t      (*bigint_mod)         (const bigint_t a,  
                                       const bigint_t b);
```

a :

b :

Returns :

bigint_set ()

```
bigint_t      (*bigint_set)        (bigint_t a,  
                                       const bigint_t b);
```

a :

b :

Returns :

bigint_set_ui ()

```
bigint_t      (*bigint_set_ui)      (bigint_t a,  
                                       unsigned long b);
```

a :

b :

Returns :

int ()

```
unsigned int () ;
```

Returns :

bigint_powm ()

```
bigint_t (*bigint_powm)(  
    bigint_t w,  
    const bigint_t b,  
    const bigint_t e,  
    const bigint_t m);
```

w :

b :

e :

m :

Returns :

bigint_addm ()

```
bigint_t (*bigint_addm)(  
    bigint_t w,  
    const bigint_t a,  
    const bigint_t b,  
    const bigint_t m);
```

w :

a :

b :

m :

Returns :

bigint_subm ()

```
bigint_t (*bigint_subm)(  
    bigint_t w,  
    const bigint_t a,  
    const bigint_t b,  
    const bigint_t m);
```

w :

a :

b :

m :

Returns :

bigint_mulm ()

```
bigint_t          (*bigint_mulm)           (bigint_t w,
                                              const bigint_t a,
                                              const bigint_t b,
                                              const bigint_t m);
```

w :

a :

b :

m :

Returns :

bigint_mul ()

```
bigint_t          (*bigint_mul)           (bigint_t w,
                                              const bigint_t a,
                                              const bigint_t b);
```

w :

a :

b :

Returns :

bigint_add_ui ()

```
bigint_t          (*bigint_add_ui)        (bigint_t w,
                                              const bigint_t a,
                                              unsigned long b);
```

w :

a :

b :

Returns :

bigint_sub_ui ()

```
bigint_t          (*bigint_sub_ui)        (bigint_t w,
                                              const bigint_t a,
                                              unsigned long b);
```

w :

a :

b :

Returns :

bigint_mul_ui ()

```
bigint_t          (*bigint_mul_ui)           (bigint_t w,  
                                              const bigint_t a,  
                                              unsigned long b);
```

w :

```

Param1 :

Param2 :

Param3 :

Returns :

gnutls_crypto_single_cipher_register()

```
#define gnutls_crypto_single_cipher_register(algo, prio, st)
```

algo:***prio***:***st***:**gnutls_crypto_single_mac_register()**

```
#define gnutls_crypto_single_mac_register(algo, prio, st)
```

algo:***prio***:***st***:**gnutls_crypto_single_digest_register()**

```
#define gnutls_crypto_single_digest_register(algo, prio, st)
```

algo:***prio***:***st***:**gnutls_crypto_single_cipher_register2 ()**

```
int gnutls_crypto_single_cipher_register2
    (gnutls_cipher_algorithm_t ←
     algorithm,
     int priority,
     int version,
     const ←
     gnutls_crypto_single_cipher_st ←
     *s);
```

This function will register a cipher algorithm to be used by gnutls. Any algorithm registered will override the included algorithms and by convention kernel implemented algorithms have priority of 90. The algorithm with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_single_cipher_register\(\)](#) macro.

algorithm: is the gnutls algorithm identifier

prio: is the priority of the algorithm

version: should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s: is a structure holding new cipher's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_single_mac_register2 ()

```
int gnutls_crypto_single_mac_register2 (gnutls_mac_algorithm_t algorithm,  
                                      int priority,  
                                      int version,  
                                      const gnutls_crypto_single_mac_st *s);
```

This function will register a MAC algorithm to be used by gnutls. Any algorithm registered will override the included algorithms and by convention kernel implemented algorithms have priority of 90. The algorithm with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_single_mac_register\(\)](#) macro.

algorithm: is the gnutls algorithm identifier

priority: is the priority of the algorithm

version: should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s: is a structure holding new algorithms's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_single_digest_register2 ()

```
int gnutls_crypto_single_digest_register2 (gnutls_digest_algorithm_t algorithm,  
                                         int priority,  
                                         int version,  
                                         const gnutls_crypto_single_digest_st *s);
```

This function will register a digest (hash) algorithm to be used by gnutls. Any algorithm registered will override the included algorithms and by convention kernel implemented algorithms have priority of 90. The algorithm with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_single_digest_register\(\)](#) macro.

algorithm: is the gnutls algorithm identifier

priority: is the priority of the algorithm

version: should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s: is a structure holding new algorithms's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_cipher_register()

```
#define gnutls_crypto_cipher_register(prio, st)
```

prio:

st:

gnutls_crypto_mac_register()

```
#define gnutls_crypto_mac_register(prio, st)
```

prio:

st:

gnutls_crypto_digest_register()

```
#define gnutls_crypto_digest_register(prio, st)
```

prio:

st:

gnutls_crypto_cipher_register2 ()

```
int gnutls_crypto_cipher_register2 (int priority,  
                                  int version,  
                                  const gnutls_crypto_cipher_st *s);
```

This function will register a cipher interface to be used by gnutls. Any interface registered will override the included engine and by convention kernel implemented interfaces should have priority of 90. The interface with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_cipher_register\(\)](#) macro.

priority : is the priority of the cipher interface

version : should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s : is a structure holding new interface's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_mac_register2 ()

```
int gnutls_crypto_mac_register2 (int priority,  
                               int version,  
                               const gnutls_crypto_mac_st *s);
```

This function will register a mac interface to be used by gnutls. Any interface registered will override the included engine and by convention kernel implemented interfaces should have priority of 90. The interface with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_digest_register\(\)](#) macro.

priority : is the priority of the mac interface

version : should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s : is a structure holding new interface's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_digest_register2 ()

```
int gnutls_crypto_digest_register2 (int priority,  
                                   int version,  
                                   const gnutls_crypto_digest_st *s);
```

This function will register a digest interface to be used by gnutls. Any interface registered will override the included engine and by convention kernel implemented interfaces should have priority of 90. The interface with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_digest_register\(\)](#) macro.

priority : is the priority of the digest interface

version : should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s : is a structure holding new interface's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_rnd_register()

```
#define gnutls_crypto_rnd_register(prio, st)
```

prio:

st:

gnutls_crypto_pk_register()

```
#define gnutls_crypto_pk_register(prio, st)
```

prio :

st :

gnutls_crypto_bigint_register()

```
#define gnutls_crypto_bigint_register(prio, st)
```

prio :

st :

gnutls_crypto_rnd_register2 ()

```
int gnutls_crypto_rnd_register2 (int priority,
                                int version,
                                const gnutls_crypto_rnd_st *s);
```

This function will register a random generator to be used by gnutls. Any generator registered will override the included generator and by convention kernel implemented generators have priority of 90. The generator with the lowest priority will be used by gnutls.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_rnd_register\(\)](#) macro.

priority : is the priority of the generator

version : should be set to [GNUTLS_CRYPTO_API_VERSION](#)

s : is a structure holding new generator's data

Returns : [GNUTLS_E_SUCCESS](#) on success, otherwise an error.

Since 2.6.0

gnutls_crypto_pk_register2 ()

```
int gnutls_crypto_pk_register2 (int priority,
                                int version,
                                const gnutls_crypto_pk_st *s);
```

This function will register an interface for gnutls to operate on public key operations. Any interface registered will override the included interface. The interface with the lowest priority will be used by gnutls.

Note that the bigint interface must interoperate with the bigint interface. Thus if this interface is updated the [gnutls_crypto_bigint_register\(\)](#) should also be used.

This function should be called before [gnutls_global_init\(\)](#).

For simplicity you can use the convenience [gnutls_crypto_pk_register\(\)](#) macro.

priority : is the priority of the interface

version : should be set to `GNUTLS_CRYPTO_API_VERSION`

s : is a structure holding new interface's data

Returns : `GNUTLS_E_SUCCESS` on success, otherwise an error.

Since 2.6.0

`gnutls_crypto_bigint_register2 ()`

```
int gnutls_crypto_bigint_register2 (int priority,
                                  int version,
                                  const gnutls_crypto_bigint_st *s);
```

This function will register an interface for gnutls to operate on big integers. Any interface registered will override the included interface. The interface with the lowest priority will be used by gnutls.

Note that the bigint interface must interoperate with the public key interface. Thus if this interface is updated the `gnutls_crypto_pk_register()` should also be used.

This function should be called before `gnutls_global_init()`.

For simplicity you can use the convenience `gnutls_crypto_bigint_register()` macro.

priority : is the priority of the interface

version : should be set to `GNUTLS_CRYPTO_API_VERSION`

s : is a structure holding new interface's data

Returns : `GNUTLS_E_SUCCESS` on success, otherwise an error.

Since 2.6.0
